    NATURE AND PATTERNS OF HOMICIDE IN   EIGHT   AMERICAN   CITIES,   1978
(ICPSR 8936)

SUMMARY: This   data   set contains detailed information on homicides in
eight United States cities: Philadelphia, Newark, Chicago, St.   Louis,
Memphis, Dallas, Oakland, and "Ashton" (a representative large   western
city).   Detailed   characteristics for each homicide victim include time
and date of homicide,   age,   gender,   race,   place   of   birth,   marital
status, living   arrangement,   occupation,   socioeconomic   status   (SES),
employment status, method of assault, location where homicide occurred,
relationship of victim to offender,   circumstances   surrounding   death,
precipitation or   resistance   of   victim,   physical evidence collected,
victim´s drug history, victim´s prior criminal record,   and   number   of
offenders identified.   Data on up to two offenders and three witnesses
are also available   including   the   criminal   history,   justice   system
disposition, and   age,   sex, and race of each offender.   Information on
the age, sex, and race of each witness also was collected as were   data
on witness   type (police informant, child, eyewitness, etc.).   Finally,
information from the medical examiner´s records   including   results   of
narcotics and blood alcohol tests of the victim are provided.   CLASS IV

UNIVERSE: Cases   in   the   United   States defined by each city´s police
department and medical examiner as homicide.
SAMPLING: A purposive sample of eight cities   was   selected   based   on
geographic region,   population   size,   and   whether   their   eleven-year
homicide trend line followed or diverged from respective regional trend
lines.   Dallas,   St.   Louis,   and   "Ashton"   diverged   from   regional
patterns, while   the other cities followed them.   Within each city, all
homicide cases were coded, except in   Chicago,   where   a   fifty-percent
systematic random sample of homicide cases was drawn.

Purpose of the Study

This data set is part of a larger project to examine patterns of homicide in the United States. This part is focused on the experience of eight selected cities to allow an analysis of various types of homicide. The other part of the project contains data on nationwide trends in homicide over an eleven year period (1968-1978) (see Riedel and Zahn, ICPSR Study 8676).

Methodology

Sources of information:

Official records of the medical examiner and police department in each city.

Sample:

The cities were selected based on geographic region, population size, and whether their eleven-year homicide trend line followed or diverged from respective regional trend lines. The final sample of cities ranged in size from 329,000 to over three million and included in the Northeast, Philadelphia and Newark; in the North Central region, Chicago and St. Louis; Memphis and Dallas represented the South; and in the West, Oakland and "Ashton" (a pseudonym) were selected. Other than the the northeastern cities, the first city listed typified the regional trend and the second one diverged from it. In the northeast region, no city diverged from the trend line; both Philadelphia and Newark were typical of the regional trend pattern. Efforts were made to use the same coders in all of the cities, although in three cities, additional coders were needed and hired. In all cities, the same coding instructions were used to train coders. The sample reflects a universe of 1978 cases defined by each city's police department and medical examiner as "homicide." The exception to this was Chicago which had over 800 homicides in 1978. A 50% systematic random sample of cases (n = 425) was collected in Chicago.

Dates of data collection:

1979-1980

Summary of Contents

Special characteristics of the study:

The data set provides an opportunity to compare characteristics of homicides in large urban areas. The variables collected are not normally available through official reporting systems (e.g., UCR) and most prior independent studies of homicide have focused on only one or two cities. Thus the scope and depth of this study make the data particularly valuable.

Description of variables:

Detailed characteristics for each homicide victim include time and date of occurrence, age, gender, race, place of birth, marital status, living arrangement, occupation, SES, employment status, method of assault, location where injury occurred, relationship of victim to offender, circumstances surrounding death, precipitation or resistance of victim, physical evidence collected, drug history, victim's prior criminal record, and number of offenders identified. Data on up to two offenders and three witnesses are also available including the criminal history, justice system disposition, and age/sex/race of each offender. Age/sex/race of each witness were also collected as were data on witness type (police informant, child, eyewitness, etc.). Finally, information from the medical examiner's records includes results of narcotics and blood alcohol tests of the victim.

Unit of observation:

Homicide victim

Geographic Coverage

Eight large U.S. cities: Philadelphia, Newark, Chicago, St. Louis, Memphis, Dallas, Oakland, and "Ashton" (a large western city).

File Structure
