## CHARLOTTE SPOUSE ASSAULT REPLICATION PROJECT:

### FINAL REPORT

J. DAVID HIRSCHEL  
IRA W. HUTCHISON III  
CHARLES W. DEAN  
JOSEPH J. KELLEY  
CAROLYN E. PESACKIS

JANUARY, 1991

Prepared under Grant No. 87-IJ-CX-K004 from the National Institute of Justice, Office of Justice Programs, U.S. Department of Justice. Points of view or opinions in this document are those of the authors and do not necessarily represent the official position or policies of the U.S. Department of Justice.

## ACKNOWLEDGMENTS

The Charlotte Spouse Assault Replication Project was implemented and completed only with the expertise and contributions of many people. We gratefully acknowledge the wisdom, knowledge and hard work of the following individuals.

### Charlotte Police Department

Chief Sam Killman was an early champion of the need for a better understanding of the role of police in spouse abuse, and without his support this project never would have been initiated. In addition, we are much indebted to the following: D.R. Stone, Assistant Chief, Operations Division; T.N. Kiser, Assistant Chief, Administrative Services Division (Ret.); R.F. Thomas, R.B. Means and S.W. Harris, Police Attorneys; Darrellynn Kiser, Administrative Assistant to the Chief; E.P. Cappell, Commander, Patrol Division; G.T. Hochstetter, Commander, Information Services Division; R.L. Schurmeier, Major; E.J. Smith, Captain, Adam Four District; M.M. Hunter, Captain, Adam Two District; A.B. Huff, Captain (Ret.), original Project Director; L.G. Sloan, Captain (Ret.), Project Coordinator; W.G. Reid, Supervisor, Data Processing Bureau; L.S. Cannon, Supervisor, Records Bureau; L.G. Congos, Clerk, Records Bureau; and to all the District Captains and officers without whose dedication and perseverance this project could not have succeeded.

### University of North Carolina at Charlotte

The research staff of the project was an energetic and dedicated group, not only in day-to-day operations, but also in responding to crises, changes, and the frequent demands for extraordinary work beyond the call of duty. Joyce Kerrigan was so diligent in her data management and analysis work that this aspect of project operations proceeded very smoothly. Bobby Brame provided excellent statistical and computer assistance and assumed a great deal of responsibility in these areas. Maureen Donohue originally had all of the data management responsibilities and saw the procedures off to an excellent start. Valerie Schmieder oversaw the laborious and sometimes painful task of interviewing hundreds of spouse assault victims. Janine Johnstone became the project's "jack and master of all trades". Lynn Chavis provided much help with data entry. Carole van Rossum uncomplainingly took on a variety of tasks. And, Brian Tallant contributed greatly to the extensive data entry requirements.

University staff were equally helpful and always available to answer questions. In particular, Lucy Henry helped manage the maze of bureaucratic requirements engendered by a very complicated research project. Donna McLain, Bonnie Hearn, and Jan Thomas in computer services provided major assistance in computerizing the project data and helping to assure high quality data records.

### Courts

Information on the disposition of spouse assault cases by the criminal justice system was collected by Julie Foster Beeman. Her work in this area provided much information and enriched the project greatly.

### Interviewers

The interviewers for this project, next to the police, had perhaps the most arduous job of all. It was their responsibility to locate and secure the cooperation of victimized women, always walking the thin line between inducing women to be interviewed and respecting their rights to say no. Katherine Reid distinguished herself not only by her success in obtaining interviews but also by her devotion to the project as an important cause. Other interviewers who beat the pavement and contributed so much were Chris Frasca, Chris Johnson, Sharon Harris, Ellen Milano, and Chris Nickel. The project owes them all a debt of gratitude for their diligence and perseverance.

### Victims

The greatest debt of gratitude is owed the several hundred women who agreed to participate in this project by being interviewed about their experiences. Necessarily, they must remain nameless. Dostoevski suggested that happy families are all alike, but that unhappy families are each miserable in their own way. Victimized women are certainly not all alike and each bears a measure of misery. The information they provided, and the pain they have had to endure, will hopefully lead to a better understanding of spouse abuse and the role of police.

### National Institute of Justice

Joel Garner, who as Project Manager, oversaw the development and implementation of this study was a helmsman who provided a wonderful balance between structured direction and project individuality while giving invaluable input on virtually every aspect of the project. Craig Uchida, who took over as Project Manager and picked up the reins of leadership so smoothly that no effort was lost in the transition, has guided the final stages of this project to a successful conclusion.

The Project Review Team was an excellent blend of expertise, experience and perspective. The Charlotte project has greatly benefitted from the overall team and from the contributions of each of its members. Al Andrews brought to the process an insider's view of police operations and provided reminders of the realities of police work. Bob Boruch's methodological and conceptual contributions to the implementation of the project and to the preparation of this report have been immeasurable. Lucy Friedman brought the insider's view of work with abused women which has been a very helpful perspective to the research staff. Kinley Larnz has been the statistician's statistician throughout the project, providing assistance on methodological and statistical issues, and rightly insisting on excellence whenever there was a temptation to pursue a less rigorous course. The contributions obtained from Al Reiss' many years of experience in conducting police research have added immeasurably to the scientific rigor and conceptual clarity of this project. The overall team, a source of wisdom and guidance, has enabled this project to achieve many very complex tasks. We thank you all.

SECTION ONE  
INTRODUCTION

The question of what constitutes the most effective, or the most appropriate, law enforcement response to spouse abuse<sup>1</sup> has stirred considerable controversy for decades. We have seen law enforcement move from a period when the emphasis was on restoring order with minimal involvement in family matters to a period when mediation and crisis intervention techniques were employed to a period when the focus has been on arresting the offender.

Until recently the law enforcement response to spouse abuse has not been guided by the results of scientific research. Although field experiments based on random assignment of treatments had been undertaken in other substantive areas, as for example in the medical, judicial and educational systems<sup>2</sup>, it was only recently that the law enforcement community began to engage in such a research approach. The Minneapolis field experiment, funded by the National Institute of Justice, tested three different randomly assigned police responses (advise, separate, and arrest) and found that, of the three, arrest was the most effective in

<sup>1</sup>Although the vast majority of cases covered in this research study are cases of spouse assault, a number involve matters that strictly do not constitute spouse assault, e.g., damage to property, criminal trespass. Hence, we have chosen to use the generic term spouse abuse in this report. As will be discussed later, we include cohabitants along with spouses in this research study.

<sup>2</sup>Comprehensive reviews of such experiments are to be found in such works as those by: Riecken & Boruch (1974) - social programs; Ferber & Hirsch (1982) - economic programs; Boruch & Wothke (1985) - welfare, education, mental health and judicial programs; Dennis (1988) - criminal and civil justice programs.

detering subsequent abuse by offenders (Sherman & Berk, 1984). The results of this landmark study provided fuel for those who were advocating that police should arrest domestic violence offenders and helped generate a nationwide movement toward the adoption of such pro-arrest policies.

The Minneapolis experiment exerted substantial impact on police policy. It was, however, a single site study and not without methodological shortcomings. In order for fundamental policy changes to be undertaken with a clear (i.e., generalizable) basis for estimating the effects of an arrest policy, additional field experiments based on random assignment were needed. In order to test the validity of the results obtained in the Minneapolis experiment the National Institute of Justice funded six additional experiments in Omaha, Atlanta, Colorado Springs, Dade County, Milwaukee, and Charlotte, North Carolina.

The Charlotte project began operations on October 1, 1986. The research design called for testing the efficacy of three police treatments: (a) advising, and possibly separating, the couple; (b) issuing a citation to the offender; and (c) arresting the offender. Cases that met specified eligibility criteria were randomly assigned to one of the three treatments, and these cases were followed for a period of at least six months to discern whether recidivism occurred. Measures of recidivism were obtained through use of official police records, and victim interviews. Victims were interviewed twice during the course of the project.

This report describes the Charlotte project and presents the study's findings. After a brief description of the changes in the law enforcement

response to domestic violence, the general features of the Charlotte project are outlined in the third section. The next five sections focus on process issues attendant to implementation of the experiment in the field. Section four examines the wider universe of calls for assistance received by the Charlotte Police Department during the time of the field experiment, section five describes the randomization procedures employed in the experiment, and section six deals with the flow of cases into the experiment, Section seven examines the content of the three treatments tested in the study, while section eight follows with a discussion of the interviews.

The next three sections present the study's central findings. While section nine focuses on outcome analyses based on an examination of official police records, section ten presents the outcome analyses obtained from the victim interviews. Section eleven integrates the findings from these two data sources. Section twelve examines how the citation and arrest cases are processed through the criminal justice system. Section thirteen, finally, discusses the significance and implications of the study's findings.

## SECTION TWO

### CHANGES IN LAW ENFORCEMENT RESPONSE TO DOMESTIC VIOLENCE

A large percentage of calls for assistance received by the police involve domestic situations. Nationwide it has been estimated that domestic violence calls constitute 15% to 40% of all calls for police assistance (U.S. Commission on Civil Rights, 1982). The majority of such calls involve the abuse of women.

Domestic violence calls were often assigned low priority (Fleming, 1979; U.S. Commission on Civil Rights, 1982). The traditional police response was one of temporary order maintenance with relatively little demand for anything more, an approach advocated by police executives and followed by line personnel. Police reluctantly responded to abuse calls, attempted to restore peace and order between the disputants, and typically left without taking more formal action.

Explanations for the avoidance of formal action are varied. First, violence within the family has been considered to be essentially a private matter; this has allowed adults to use force to solve personal disputes (Breslin, 1978; Martin, 1976). Second, female victims have been perceived as uncooperative and this, it is believed, makes arresting abusers a waste of time (U.S. Commission on Civil Rights, 1982). Such thinking has slowly given way to a realization that victim decisions to help prosecutors are influenced by interactions between victims and the criminal justice system (see, e.g. Ford, 1983). Third, there is a concern that taking action against abusers hurts their families, especially those members financially dependent on the offenders (U.S. Department of Justice, 1984). Finally,

Martin (1976) and others argued that responding officers, who are usually male, typically side with offenders, thus reinforcing a cultural norm stressing male superiority.

In the 1960's, under the influence of social scientists, psychologists, and a developing women's movement, the old order maintenance approach received a professional twist. Mediation and crisis intervention emerged as the tools for dealing with family violence. This led to police training in crisis intervention techniques (Bard, 1975; Spitzner & McGee, 1975), the establishment of police family crisis intervention units (Bard, 1975), and police crisis teams composed of police officers and social workers (Burnett et al., 1976).

Despite this added training and the use of specialized units, there is little evidence that crisis intervention and mediation were successful. Oppenlander (1982), for one, reported that police tended to make more arrests in abusive situations than in other cases, even though crisis intervention approaches often took precedence over arrest. However, there were relatively few evaluations (see, e.g. Pearce & Snortum, 1983; Wylie et al., 1976; Bard, 1970) to assess the impacts of these changes which occurred before controlled experimental research was conducted on police policy.

In addition, many police officers did not welcome these changes. Mediation seemed more like social work than police work. Moreover, some commentators (e.g., Langley & Levy, 1978) thought that the police were inadequately prepared to perform family crisis intervention services. Others also worried about applying crisis intervention techniques and mediation to abuse situations. Loving (1980), for example, wrote that crisis intervention techniques designed for situations in which there was

verbal abuse were being inappropriately applied to situations involving physical assaults.

The Attorney General's Task Force on Family Violence (U.S. Department of Justice, 1984) identified a potential flaw in the mediation approach. The process of mediation assumes that there is some equality of power and culpability between the parties to a dispute. Assuming equal power is wrong in abuse situations, especially if Walker's (1979) concept of "learned helplessness" applies to many victims. The assumption of equal culpability and a failure to hold the offender accountable for his actions gives him no incentive to reform. Thus, "rather than stopping the violence and providing protection for the victim, mediation may inadvertently contribute to a dangerous escalation of violence" (U.S. Department of Justice, 1984, p. 23).

These concerns about crisis intervention and mediation, coupled with arguments that the rights of female victims were violated by the failure of police enforcement, produced demands for the arrest of abusers as the appropriate police response (Langley & Levy, 1978; U.S. Commission on Civil Rights, 1982). In some jurisdictions, women's groups filed suits to effect this change in policy (see e.g. Bruno v. Codd, 396 N.Y.S. 974 (1977); Scott v. Hart, No. 6-76-2395 (N.D.Cal:1976); Thurman v. City of Torrington, 595 F.Supp. 1521 (D. Conn. 1984)). The rationale for advocating arrest is clear. As the Attorney General's Task Force on Family Violence unequivocally stated: "The legal response to family violence must be guided primarily by the nature of the abusive act, not the relationship between the victim and the abuser" (U.S. Department of Justice, 1984, p. 4).

The movement toward arrest as the preferred policy in the abuse of women was fueled by the results of the Minneapolis experiment. In this study Sherman and Berk (1984) had certain eligible misdemeanor domestic assault cases, in which both the offender and the victim were present when the police arrived on the scene, randomly assigned to one of three treatment responses: (a) advising the couple; (b) separating the couple; or (c) arresting the offender. They found, through examining official police records and conducting victim interviews every two weeks for six months, that of these three treatment responses arrest was the most effective in terms of deterring subsequent abuse.

Both the researchers themselves (see e.g. Sherman & Berk, 1984, pp. 263-266, 269) and others (see, e.g. Lempert, 1989, pp. 152-154; Binder & Meeker, 1988) have pointed out problems with the study. These problems have included such issues as: inadequate sample size; a disproportionate number of cases submitted by a few officers; inadequate controls over the treatments actually delivered; the possibility of surveillance effects caused by multiple follow-up interviews; and, lack of generalizability of the findings due to attributes of the city in which the sample was obtained and the sample itself.

Despite these methodological problems, this landmark study received unprecedented national attention and is credited with helping to promote the nationwide movement toward arrest as the preferred response in abuse cases (Sherman & Cohn, 1989; Law Enforcement News, 1987). A follow up study by the Crime Control Institute (Sherman & Cohn, 1989; Law Enforcement News, 1987) investigated arrest policies in cities with populations of more than 100,000. This research, based on telephone surveys conducted in 1984, 1985, and 1986, identified 78 cities in 27

states which had moved to preferred arrest policies by 1986. The trend toward adopting arrest as the preferred response for domestic violence cases is, therefore, indisputable. For some, however, we have proceeded too far on the basis of too little evidence (see e.g., Binder and Meeker, 1988).

## SECTION THREE

### DESCRIPTION OF THE PROJECT

#### Initial Development of the Project

The study of police response to spouse abuse in Charlotte was initiated in response to a National Institute of Justice request for proposals to replicate and extend the Minneapolis experiment. As discussed in the previous section, the Minneapolis experiment had been used as a basis for many police departments to determine their own policies. The necessity of validating the results of this study led the National Institute of Justice to solicit proposals for additional experiments.

Representatives of the Charlotte Police Department requested faculty of the Department of Criminal Justice at the University of North Carolina at Charlotte to join in responding to the NIJ solicitation. A research team was organized and the initial proposal was submitted on March 3, 1986. A May 16, 1986 letter informed the Charlotte research group that Charlotte was one of five sites selected for further consideration. Elaboration of certain aspects of the research design was requested prior to a funding decision.

After due consideration of the modified proposals, projects were funded in five sites: Atlanta, Colorado Springs, Dade County, Milwaukee, and Charlotte. A sixth site, Omaha, had been funded at an earlier date. The panel of experts that reviewed the grant proposals remained as the Program Review Team to help guide and coordinate the development and implementation of the projects. The starting date for the Charlotte project was October 1, 1986.

#### The Research Location

Although it is important to understand the context in which policy experiments are conducted, they are not described as often as they should

be. In this subsection a brief description of the research context is provided.

(a) The City of Charlotte

Charlotte is the largest urban area between Washington, D.C. and Atlanta, Georgia. Located on the border between North and South Carolina, the city covers an estimated 160 square miles. The population in 1986 was 352,070 (U.S. Bureau of the Census, County and City Data Book, 1988, p. 690). The 1990 population estimates place 390,000 people within the city, 483,000 within the county, and 1,200,000 within the Metropolitan Statistical Area which includes the local county and six surrounding counties. The ratio of whites to blacks within the city is about 2:1 (67.4% white versus 31.1% black based on census data).

The city has never been heavily industrialized and has become a regional center for banking and commerce. Along with the general explosion of growth in the Sunbelt in the 1970's and 1980's, Charlotte acquired a wide range of light and high tech industries. Economically the city remains diversified. Unemployment rates are generally lower than in other parts of the state or the nation as a whole, and have seldom exceeded 5% in the past decade. The average household income in 1988 was \$34,000, and per capita income was \$13,463 (Charlotte Chamber of Commerce, 1990).

Like many other cities, Charlotte's rapid growth has been accompanied by increases in traffic congestion, violence and other serious crimes. Increases in public and social services have not kept pace with the rapid expansions in either geographical area or population.

(b) The Charlotte Police Department

The Charlotte Police force has over 1,000 employees. Civilians account for approximately 20% of the workforce. The sworn officers are

divided into patrol, investigative, and administrative divisions with the patrol division constituting over 75% of the sworn personnel.

At the inception of the project in 1987 police operations (patrol) was divided into two divisions (Adam and Baker) with each of these divisions subdivided into four districts (i.e., Adam 1, Adam 2, etc.) for a total of eight patrol districts. On January 4, 1989, as a result of a manpower study conducted to determine the most efficient use of patrol officers, the districts were changed. The new schema set up three divisions (Adam, Baker and Charlie) with three districts in each division.

The majority (66%) of the Charlotte patrol officers are white males. The remainder comprise black male officers (17%), white female officers (12%), and black female officers (5%). More than 50% of the patrol officers have been on the force less than three years.

#### Outline of the Charlotte Project

The Charlotte project was a replication and extension of the Minneapolis experiment in which the efficacy of three police responses (treatments) to spouse abuse was tested. The three treatments utilized by the Charlotte project were: (a) advising, and possibly separating, the couple; (b) issuing a citation to the offender (an order requiring the offender to appear in court to answer specific charges); and (c) arresting the offender. Cases that met specified eligibility criteria were randomly assigned to the three treatments and these cases were followed for a period of at least six months to discern whether recidivism occurred. Measures of recidivism were obtained through use of official police records, and victim interviews. The research design called for victims to be interviewed twice during the course of the project: shortly after the presenting incident, and six months after the presenting incident.

## Eligibility Criteria

In order for a case (a call for police assistance involving a domestic dispute between a couple) to be included in the experiment it had to meet a significant number of eligibility criteria. Eligibility criteria are both complex and numerous. To facilitate their presentation, we have divided them into three categories: legal requirements, policy judgments, and/or matters of research design.

### (a) Legal Criteria

The overriding legal criterion guiding this experiment was that eligible cases must have been classified as misdemeanor offenses. The reason for this criterion is that a spouse assault incident must have been such that any of the three (randomly assigned) treatments could have been assigned but none was required. For example, if a particular spouse assault incident was judged by the responding officer not to be sufficiently serious to constitute a misdemeanor, then by legal definition no crime had been committed. In the absence of the commission of a crime, responding officers do not have "probable cause to believe that a crime has been committed," and thus do not have the authority to make an arrest. Since an arrest could not have been made in this particular situation, the case could not have been eligible because all three treatments had to have been viable options.

Conversely, a case might be ineligible because it occurred at the most serious end of domestic violence, the commission of a felony. If a felony is committed, an arrest is mandatory, and it follows that neither of the other two treatments would have been options for assignment.

In some circumstances, an arrest might also have been required, but for reasons unrelated to the domestic incident for which the call for police service was made. For instance, a suspect might have been subject

to an outstanding warrant, or under a restraining order. Since these circumstances require an arrest, such a case could not have been eligible.

In short, the requirement that eligible cases fall within the misdemeanor range of incidents ensured the selection of cases in which police were empowered but not required to make an arrest, and, by extension, empowered but not required to implement either of the other two treatments.

#### (b) Policy Criteria

Other eligibility criteria were determined by policy judgments made by the Charlotte Police Department and the research staff. The conceptual framework developed for this study led to the suggestion that the types of subjects in the experiment be kept as homogeneous as possible in order to strengthen statistical power, increase precision in estimating effects, and enhance clarity of interpretation. At the same time, policy usually focuses on diverse groups. Therefore, to achieve a balance, the Charlotte project took a relatively literal interpretation of the concept of spouse and decided to focus only on spouse and spouse-like relationships. We excluded other family relationships such as parent-child, and siblings. Non-cohabiting boyfriend-girlfriend relationships were excluded because they lacked the living together component of a spousal relationship. Similarly, while same sex couples could have been included they were not because predominant norms do not treat such couples as spouses.

There was a theoretical reason for a narrow definition of spouse abuse. One of the explanations for the results of the Minneapolis experiment was that women whose partners had been arrested for assaultive behavior became more "empowered", and that such empowerment somehow reduced the likelihood of future assaultive behavior, perhaps by equalizing some of the power in the relationship. The empowerment

hypothesis is inappropriate in looking at parent-child relationships where there is a normative and expected inequity in the power distribution. Thus, while arresting assaultive parents may have a punitive effect, the concept of empowerment is relatively irrelevant. Similarly, while one could make the case that empowerment is appropriate in boyfriend-girlfriend relationships, we concluded that such relationships are often unstable and that attempting to assess the efficacy of different treatments would be difficult.

From a pragmatic standpoint we speculated that many communities, already strapped by limited resources, would not accept or support the provision of additional police or social services for certain populations. We believed that including same-sex relationships, boyfriend-girlfriend relationships, or male victim/female offender relationships might have so diluted the eventual support for policy recommendations that to do so would have been unwise.

Cases in which either the victim or the offender was under the age of 18 were also excluded. This was due to the concern that special research instruments and special parental approval procedures would have been required if either minor victims or minor offenders had been included in the experiment.

To sum the eligibility criteria discussed thus far, it was decided that in order to be included in the Charlotte experiment a case had to involve a misdemeanor offense committed by a male offender, aged 18 or over, on a female victim, aged 18 or over, and these two had to be spouses, ex-spouses, cohabitants, or ex-cohabitants.

Policy judgments of a different nature were involved in the decision to exclude three additional types of cases. In this study major emphasis was placed on both victim and officer safety. A fundamental premise of

the research design was that the project should not pose any additional danger either to the victim or to the responding officers. As a consequence, it was decided that cases in which the victim was insisting on the arrest of the offender, cases where the the suspect had threatened or assaulted the officer, and cases where the officers believed the suspect posed imminent danger to the victim, should all be excluded from the experiment. In this way officers remained free to make arrests in these types of situations without being restrained by any features of the research design.

(c) Research Criteria

The final eligibility criterion arose directly from the research design. Since it was not possible for the responding officers to deliver all of the treatment responses if either the victim or the suspect were gone from the scene, if either were gone the case was deemed ineligible for inclusion in the experiment.

It was also decided as part of the research design that repeat cases involving the same victim and the same suspect would be included only once in the primary outcome analysis since the project was going to use dyads rather than individual cases as the units of analysis. However, since it was not possible for officers in the field to know immediately whether a dyad had previously been involved in the experiment it was decided that repeat cases should not be excluded from random assignment, but should instead have the treatment randomly assigned and then be excluded from the primary outcome analyses. It should be noted, however, that although such cases were excluded from primary outcome analysis, some secondary analyses were conducted using repeat cases as new cases (see Section Nine).

## North Carolina Law

The North Carolina law governing police powers of arrest is found in North Carolina General Statutes Section 15A-401. In misdemeanor cases a police officer may arrest without a warrant anyone whom the officer has probable cause to believe has committed a criminal offense in the officer's presence (N.C. Gen. Stat. Sec. 15A-401(b)(1)). With regard to an offense committed out of the presence of the officer, an officer may make a warrantless arrest when the officer has probable cause to believe that (a) the offender has committed a misdemeanor; and (b) the offender either (i) will not be apprehended unless immediately arrested, or (ii) may cause physical injury to himself or others, or damage to property unless immediately arrested (N.C. Gen. Stat. Sec. 15A-401(b)(2)). These powers of warrantless arrest are subject to interpretation and are not as broad as those bestowed on officers in some other states.

Although citations are not usually used in spouse abuse cases, North Carolina law clearly permits such use of the citation process. North Carolina General Statutes Section 15A-302 authorizes a police officer to issue a citation "to any person whom he has probable cause to believe has committed a misdemeanor." Thus, no changes were necessary in existing laws to provide for the citation option in this spouse assault experiment.

## The Treatments

The three treatments utilized were, as mentioned above: (a) advising, with or without separating the couple; (b) issuing a citation to the offender; and (c) arresting the offender. Two features were common to all three treatments. First, the responding officers were to attempt to calm matters down and restore some semblance of order. And second, each victim was to be given a Victim Information card which provided the victim

with some basic details about the availability of local resources that could be of assistance, namely the Victim Assistance Program and the Battered Women's Shelter. In addition, general police procedures allowed officers to transport a person to another location.

The advise/separate treatment required the officers play an active role in attempting to help the couple solve their immediate problem, possibly referring the subjects to some appropriate social service agency or asking one of the subjects to leave the residence for a period of time.

Although the original research design of the Charlotte project included distinct advise and separate categories, this part of the design was modified for a number of reasons. First, while police have the legal authority to request one of the subjects to leave, they do not possess the authority to order one of them to leave. Second, it appeared likely that there would be problems in maintaining the distinction between these two treatments. It was projected that when the advise treatment was administered one of the subjects might decide to leave anyway. On the other hand, when the separation treatment was administered, the party that had left might return as soon as the officers had departed from the scene.

The arrest treatment required that the suspect be arrested: namely, that he be taken into custody, handcuffed, and transported to the local jail for an appearance before a magistrate. Finally, the citation treatment required that the officers issue the offender a standard citation, and explain the citation to both the victim and the offender.

Other distinctive features of the Charlotte project were that it utilized the whole patrol force and that it operated citywide twenty-four hours a day. In the planning stages there had been considerable

discussion as to whether the Charlotte project would be better advised to utilize an "elite squad" and/or operate in only specified sections of the city on specific shifts. The "elite squad" would have consisted of a limited number of officers who would have been responsible for responding to all spouse abuse calls. Problems could be anticipated with the use of an elite squad. First, there would be difficulty in ensuring that the appropriate cases were handled by members of the elite squad when the exact nature of calls, and particularly whether they involved spouse abuse, could not be easily determined by dispatch. Second, the availability of a specialized unit could not always be guaranteed. And third, it was desirable to have the same standard operating procedures for all patrol officers.

A combination of research and operational issues thus led to the conclusion that utilizing the whole force would increase the pool of eligible cases and make the research results more generalizable. Utilizing more than five hundred patrol officers in the experiment was not without its problems. The large numbers made both training and field supervision more difficult. The issue of lack of police cooperation, and consequent circumvention of project guidelines, was encountered in the Minneapolis experiment and was the subject of much concern in the Charlotte project.

The operational procedures for officers were not complicated. Officers responded to a call for service by going to the scene, and determining whether the case met all of the eligibility criteria. If so, the officers radioed the dispatcher for a treatment code which was randomly assigned by the computer. The officers then carried out the mandated treatment code unless something occurred that prevented them

from doing so. If, for example, after an advise/separate code had been received the suspect assaulted an officer, an arrest would be made and the case would become a misassignment of treatment. Throughout the project officers were held accountable for deviations from the assigned treatments by having to provide written explanations for actions they took in the field (see Section Six).

### Police Training

Prior to commencement of training a detailed briefing session was held for officers at the rank of captain and above. In addition, the project sponsored a luncheon for sergeants, which was also attended by officers of higher rank. The attendees were addressed by both the Chief of Police and the Assistant City Manager, and were given an overview of the study by project staff.

The training program for police personnel was initiated in June, 1987, and was conducted jointly by police personnel and project research staff. All patrol officers and their sergeants were required to attend one four hour training session.

In order to emphasize the significance of the project, these training sessions were usually opened with remarks from the Assistant City Manager and the Assistant Chief for Patrol Operations. Their introductory comments focused on the seriousness of spouse assault as a community problem, the commitment of the police command to the project, and the expectation that the project would help produce better guidelines for handling spouse assault situations.

Using a classroom setting with groups of 40-50 officers, the training sessions included six components: (1) a general introduction and overview of the project; (2) the criteria required for case eligibility; (3) the

randomization process, the reasons for randomization, and the procedures for securing the treatment codes; (4) the prescribed method of implementing each of the three treatments; (5) the forms to be used for the project, and (6) legal issues involved in carrying out the project, in particular, police powers of arrest in spouse abuse cases. (Charlotte S.A.R.P. Procedures Manual, 1987).

As would be expected in training any large group of people to do something new, there was variation in the officers' general response. A few were openly enthusiastic and eager; a few were antagonistic and obdurate; most seemed willing to take a "wait and see" attitude.

While there were questions and discussion on almost every aspect of the project at some point in the training sessions, a few issues were raised repeatedly and seemed to be the most troublesome to the officers.

First, there was extensive discussion over the distinction between eligible and ineligible cases, and the correct point at which officers should call to request the treatment code. Of major concern was the need to make the eligibility/ineligibility determination as rapidly as possible and request the treatment code before any other police management of the situation had taken place.

Second, there was shock and a certain amount of incredulity that treatment codes would be generated by a computer. Officers viewed this as a serious loss of the discretion they considered necessary for handling assault situations. Initially some officers had believed that the civilian dispatchers were going to make the random assignment. There appeared to be mixed feelings when they realized it was the computer, rather than a dispatcher that was going to make the assignment. Most of the officers seemed to understand the necessity for computer assignment,

but many did not like it. Comments heard during training included: "Roll the dice" and "Let's play Russian Roulette." Officer feelings were openly discussed and to the extent possible issues were resolved.

Third, extra paperwork was clearly going to be required. Part of the research design was to require as much paperwork for ineligible as eligible cases in order to reduce the likelihood that cases would be deemed ineligible because an officer did not want to complete the paperwork. Moreover, even for cases for which there was no probable cause, additional time was required to complete the modified miscellaneous incident form.

The fourth troublesome area concerned the fact that if an arrest code was assigned to an eligible case, the responding officer was required to make an arrest, even if the victim demanded that the offender not be arrested. Some officers saw this procedure as an infringement on the victim's rights that might cause them additional problems, and a waste of time since the victim would not follow through with prosecution.

Fifth, and probably the most time consuming, were a variety of legal issues. Officers requested clarification of their powers of arrest and generated discussion on the fine line between deeming a case eligible because an offender posed a threat of physical injury to the victim (one of the criteria for making a warrantless misdemeanor arrest) and deeming it ineligible because he posed an imminent danger to her. Some undoubtedly understood their powers of warrantless arrest to be quite narrow. This subjective interpretation by individual officers of the definition of sufficient grounds for a misdemeanor arrest may have had an impact on subsequent case flow. Perhaps the most frequently voiced concerns of the officers in training were over apprehensions of being

legally charged with false arrest. These concerns were vocalized despite the presentation of information that police nationwide had been more often sued for failure to arrest in severe domestic situations than sued for false arrest.

Sixth, there was concern among some officers that implementing the citation code might increase the level of danger facing the victim once the officers left. Project staff conducted follow-up phone interviews with women during the pretest and determined that (although based on a small sample) issuing a citation did not increase the risk of immediate violence. These results were passed on to officers.

Finally, it was clear from the design, the substance, and the tone of the training sessions that considerable attention was to be devoted to following the flow of disposition of calls for service; i.e., every call for service dispatched as or determined on arrival to be a domestic situation had to be accounted for by one of three forms. This level of accountability and increased paperwork is unusual and may have produced some resistance.

In general, the training sessions proceeded smoothly despite the issues indicated above. There was often good-natured bantering between the officers and the presenters and only occasional hostility. Our best judgment was that the clear majority of officers, while not happy about what they perceived as additional work, requirements, and expectations, nonetheless viewed the project as part of their jobs which they would perform as diligently as possible.

After the completion of the initial training sessions three types of subsequent training ensued. First, early in the experimental phase of the research, there was occasional confusion about specific procedures. Some

of these issues were handled by memoranda from the police line command. Other issues appeared sufficiently problematic to warrant a project representative (either the police liaison officer or one of the project research staff) attending roll calls of the different shifts in order to clarify the specific problem. Second, some experienced officers did not attend the initial training sessions because they were on different assignments and were transferred to patrol later in the project. This training was frequently handled on an individual basis by police personnel.

Third, as new classes of recruits went through the training academy, part of their basic training was devoted to a presentation on the spouse assault project. Although these training sessions covered the same topics as the primary training sessions, they were not as comprehensive. In general they were not attended by the police "high command" as had been the primary training sessions. In addition, the training for the spouse abuse project came amidst training for multiple other requirements and demands of the job. This was very different from the primary training sessions which took patrol officers off active duty in order to attend the required sessions. Finally, the training may have been impacted by the fact that the classes of new recruits were largely homogeneous in terms of experience. Unlike the primary training sessions, the new recruit classes were not enriched by experienced officers' accounts of dilemmas in handling domestic situations. It is uncertain whether this had a positive or negative effect in terms of making the recruits receptive to the requirements of the experiment.

#### The Pretest

The purpose of the pretest was to provide a trial of the experimental

design and police procedures before the actual experiment began. Such trials can be important in the early identification and elimination of problems. The field experiment began on June 13, 1987 with a pretest phase that lasted until August 7, 1987. Police officers had not been informed that the data collection period included a pretest.

As expected, there were some initial problems. In one of the first randomized cases the responding officer duly carried out the designated arrest treatment and took the offender downtown only to have the examining magistrate refuse to find probable cause. News of this spread like wildfire through the department. The project appeared in jeopardy. Instead of determining that there was sufficient evidence for a finding of probable cause, the magistrate had decided that the district attorney's office probably would not prosecute the case and had dismissed it on that basis. A meeting attended by police and project personnel, the chief magistrate, an assistant district attorney, and other criminal justice officials was hastily convened before the presiding district court judge. After hearing the evidence the judge determined that the magistrate had in fact made a policy determination on his/her estimation of prosecutability and ruled that the magistrates should be instructed to make legal, not policy, assessments. Fortunately for the project, the crisis had been resolved by a clear directive that was to remain in force throughout the duration of the project.

Data gathered during the pretest indicated that in Charlotte, as in a number of the other sites, the case flow of eligible cases was less than anticipated. During this eight-week pretest period, the project received 78 eligible cases at an average of 1.4 eligible cases a day. This represented only a small minority (5.8%) of the domestic calls for service

received by the police. The great majority (71.8%) of all the domestic calls involved situations where probable cause to believe that a crime had been committed did not exist and officers had submitted the domestic violence miscellaneous incident reporting form. Approximately 1 in 5 (22.3%) of all domestic calls consisted of situations involving spouses, ex-spouses, cohabitants or ex-cohabitants where there was probable cause to believe that a crime had been committed, but the case did not satisfy one or more of the other eligibility criteria (hereafter called ineligible cases, of which there were 300 in the pretest period). It should be noted, however, that there were major problems in the early stages of the pretest with officers not filling out the domestic violence miscellaneous incident forms. This led to an under-estimate of the percentage of cases in which officers failed to find probable cause and a consequent over-estimate of the percentages of both eligible and ineligible cases.

There were two prime reasons that cases were deemed ineligible during the pretest. The most frequent cause of ineligibility was that "the offender was gone on arrival." This factor alone was responsible for 46% of all ineligible cases. Second, "victim insisted on arrest," was a source of ineligibility in 42% of the cases. Since these two police responses occurred so frequently and were having such a strong negative effect on case flow, a follow up study was conducted. A telephone survey of some 49 victims, whose cases were deemed ineligible solely because the offender was gone when the officers arrived on the scene, verified that in all but one case the offender had, in fact, been gone. In that one case the offender had been asleep upstairs when the officers arrived.

Examination of the "victim insisted on arrest" category revealed that officers were applying this category in a number of different ways. Some

officers correctly interpreted this category to mean that they either made an immediate arrest of the offender or took the victim downtown to swear out a warrant. Other officers, however, wrongly believed that if the victim indicated she intended to take out a warrant (even though the officers doubted she would follow through with the action), this was sufficient. To clarify the situation, a police department memorandum was issued informing officers that if they declared a case ineligible because "the victim insisted on arrest," the officers must either (a) make an on the scene arrest, or (b) if the offender was not present, immediately obtain an arrest warrant.

Data collection for the experiment began officially August 8, 1987, when project personnel were confident that all guidelines were understood and enforceable.

## SECTION FOUR

### THE CHARLOTTE PIPELINE OF INCIDENTS REPORTED TO THE POLICE<sup>1</sup>

Since the inception of the project the Charlotte research team favored a strict interpretation of the term "spouse" and considered that only cases involving heterosexual spouses and cohabitants fell within the ambit of the project. Thus the Charlotte project did not include in the experiment cases that involved disputes between, for example, parent and child, siblings, or same-sex cohabitants. One issue of concern is how representative the cases included in the experiment are of all such calls received by the police department. Most of the experimental cases were, as detailed below, dispatched as 10-91's (the Charlotte Police Department's designated code for calls for service which involve domestic disturbance, hereafter referred to as 10-91's). However a significant minority were not. Conversely, a great number of 10-91 calls were domestic disturbance situations that did not involve heterosexual spouses or cohabitants. Thus, dispatch code alone cannot be used to determine the universe of cases which is of interest.

Prior to the inception of the research project the Charlotte Police Department routinely collected basic information on calls for service, and on both probable cause and non-probable cause cases. However, much of this information was not computerized and none of it was presented utilizing the cohabitant and ex-cohabitant relationship categories employed in this research study. As a consequence, the Charlotte Police Department agreed to use two additional forms for this project. One, the

<sup>1</sup> The project staff are greatly indebted to Dr. Al Reiss for his suggestions, guidance and direction in the design and implementation of this pipeline study.

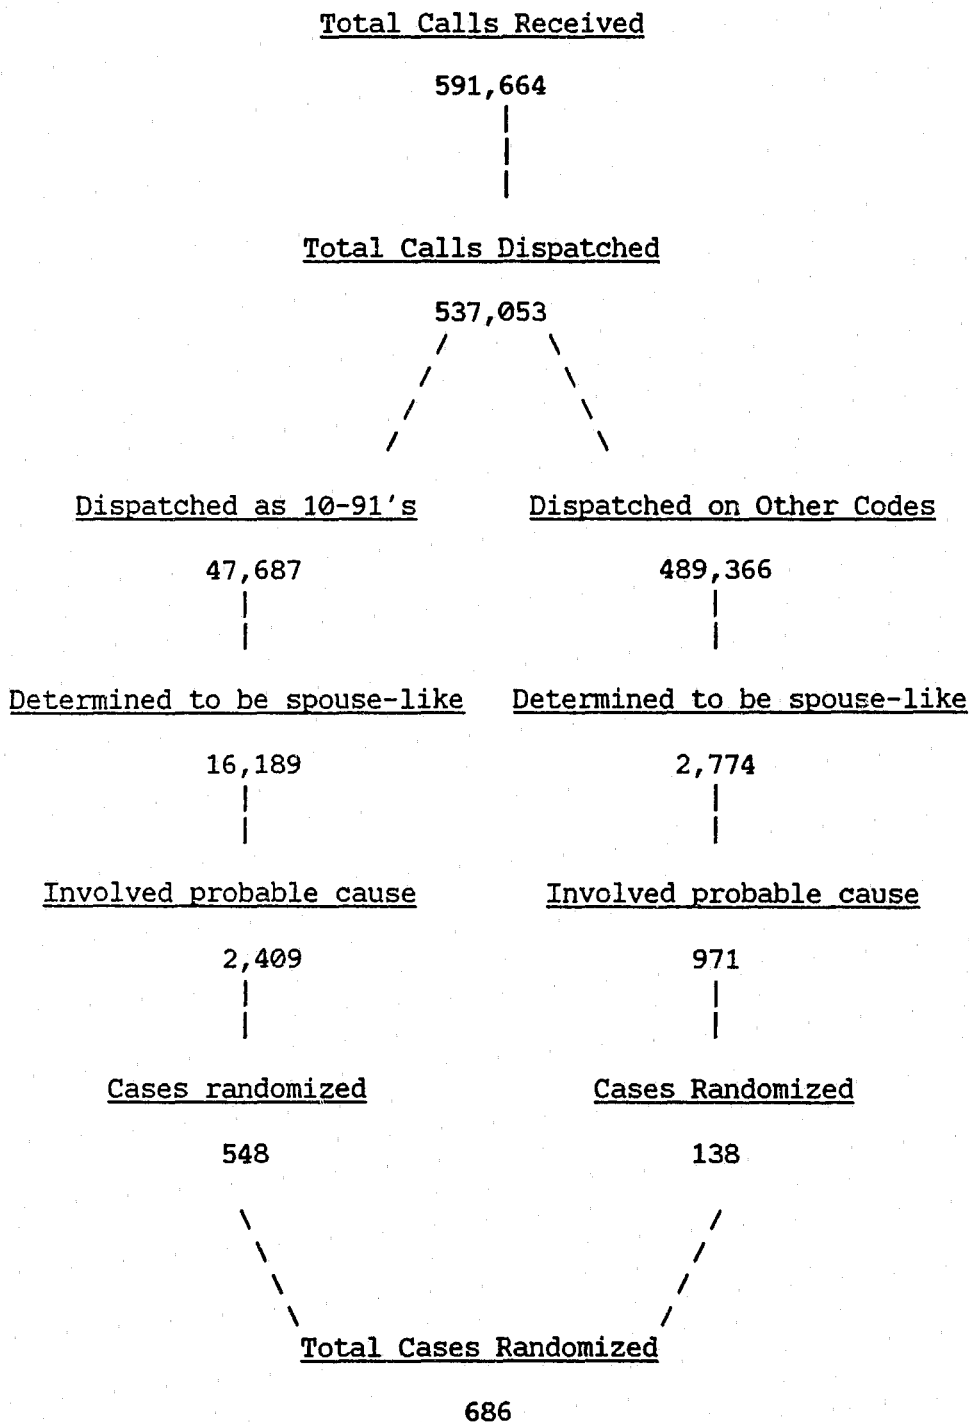

Domestic Violence Supplement Report (see Appendix A, item # 1), was completed for all spouse-like cases in which there was probable cause to believe that a crime had been committed. As its title indicates, this form was used as a supplement to the existing offense report (see Appendix A, item # 2). The second, the Domestic Violence Miscellaneous Incident form (see Appendix A, item # 3), was completed in all non-probable cause domestic violence cases. These included both spouse-like and non spouse-like (e.g. parent-child, brother-sister) cases. Through use of these forms and call for service data detailed information was obtained on all domestic violence calls received by the Charlotte Police Department.

The information contained in Chart 4-A provides a description of the flow of cases received by the Charlotte Police Department during the period August 8, 1987 to June 30, 1989. As can be seen from the chart, 591,664 calls for assistance were received, most of which (537,063; 90.8%) resulted in an officer being dispatched to the scene. Only a minority (47,687; 8.9%) of these calls were dispatched as 10-91's (the domestic disturbance code). Of the 47,687 dispatched as 10-91's, 16,189 (33.9%) were determined at the scene to involve spouse-like situations. Of the 16,189 spouse-like situations, 2,409 (14.9%) were cases in which police officers decided that they had probable cause to believe that a misdemeanor offense had occurred, and 548 (3.4%) resulted in randomized eligible cases.

For calls that had been dispatched on other codes 2,774 (0.6%) involved spouse-like situations, with 971 (35.0%) of these being probable cause spouse-like situations, and 138 (5.0%) resulting in randomized eligible cases. The primary codes on which the 2,744 non 10-91 spouses like calls were dispatched were: 10-90 (assault, 791 cases); 10-93 (disturbance, 292 cases); and 10-63 (investigate \_\_ at \_\_, 233 cases).

CHART 4-A

FLOW OF CALLS FOR ASSISTANCE RECEIVED BY THE  
CHARLOTTE P.D. (AUGUST 8, 1987 - JUNE 30, 1989)

Source: Charlotte P.D. call for Service Data, Domestic Incident Reports and Police OR/SR Reports; Jobfiles - Mistudy and Mergestudy; Datafiles - MIS/Reports/Study; Variables - Spouselike= Vsrelat2 (1,2,3,4 and 5); Dspchcde, Elgbcase, Sfelony, Ofnstype and Ofnsclas.

While 548 (79.9%) of the final total of 686 eligible cases were dispatched on the 10-91 code, 138 (20.1%) were dispatched on other codes, indicating that not all domestic violence cases are dispatched as 10-91's.

There was a total of 19,002 non-probable cause cases on which more detailed analysis was conducted, 8,913 of which were known to involve spouse-like situations. As can be seen from an examination of Table 4-1, the non-probable cause cases, like the probable cause cases, are most likely to involve marrieds, cohabitants and blacks. Typically the responding officers encountered what was a "shouting match" (26.1% of the time) or found that the complainant was gone when they arrived (21.5% of the time). After arriving on the scene the officers generally took no action (50.4% of the time) or simply calmed things down (26.2% of the time).

This analysis of the calls for assistance received by the Charlotte Police Department documents that only a small percentage of domestic calls resulted in randomized eligible cases. The vast majority of calls to which the police responded were determined by the responding officers to involve situations in which they did not have probable cause to believe that a crime had been committed. These cases differ from both eligible and ineligible cases in that they involve relatively benign situations without any of the more serious factors present in those types of cases.

## SECTION FIVE

### RANDOMIZATION<sup>1</sup>

The purpose of randomly assigning cases into groups is to create groups which are as similar as possible, and without systematic differences between them. The elimination of systematic bias allows legitimate statistical statements to be made about experimental outcomes. Although groups of cases randomly assigned to different treatment categories may be very similar with regard to all background characteristics, they will never be exactly the same. Nor should they be expected to be since a certain amount of random variation is to be anticipated. Proper randomization will, however, eliminate systematic bias.

The procedures for the random assignment of treatments in this experiment were developed through the combined efforts of computer personnel in the Charlotte police department and the UNCC research staff. The procedures employed utilized the time stamp assigned to every call for assistance received by the Charlotte Police Department.

When any call for service is received at the Charlotte Police Department the complaint-taker brings up a format on the computer that is stamped with the time when the citizen makes the initial contact. The time field is a five digit field for seconds. It is the cumulative seconds at that time for that day, for instance 01234.

It was proposed that this time stamp be utilized to generate the random treatment assignments. The process was extremely simple. By dividing the time field by 3 and adding 1 to the remainder, a digit of 1, 2, or 3 would be produced which would represent the code for the assigned

<sup>1</sup>The conceptualization, implementation, and integrity of the randomization plan was greatly enhanced by the assistance of Dr. Kinley Larntz.

treatment response. This digit would then be shown in an existing field on the dispatcher's screen when the call was displayed and would be displayed for all calls.

This procedure is based on the time a call is received. It is not subject to manipulation since the time stamp occurs before the telecommunication is informed of the reason for the call. Thus, whether the call is about spouse abuse is not known at the time of the time stamp. The time based number generation is a classical COBOL random number generation technique. This procedure, it was believed, would be an efficient use of the CAD system and would minimally affect the computer's response time.

Assigning the random number to all calls received by the police department appeared to meet project research needs with the least possible disruption to police operations. To check that the process was operating as intended, one day's randomizations were given to the Project Review Team for independent inspection. The assignments were tested and it was discovered that 21 of 889 cases did not generate the expected code. In checking these cases, police personnel determined that all 21 cases were exceptional. In each case an additional police request had been made for a crime scene search unit. This request generated a second time stamp. The second time stamp in conjunction with the original code (associated with the first time stamp) erroneously made it appear that there was a problem with the randomization process.

A second issue arose prior to implementation of the experiment. It was possible for the dispatcher (and the officer) to know the code before the case was determined to be eligible. Thus, knowledge of the code could influence the determination of case eligibility by the officer. The computer program was modified so that, while still assigned to all calls,

the randomized number appeared on the dispatcher's screen only when requested by the dispatcher after the officer had arrived on the scene and determined case eligibility. Prior to this time the field remained blocked, so that neither the dispatcher nor the officer could know what the assigned code would be.

A third issue faced by the project team concerned the process to be employed when the computer was down. It was decided that sealed envelopes with random assignments in them would be kept by dispatch to be used in the event the computer was down when a treatment code was requested. The project staff randomly assigned treatment codes to numbered envelopes which were sealed after a record had been made of which treatment had been assigned to each envelope. The sole listing of the codes contained in each envelope was kept in a locked file cabinet in an office at UNCC so that each time an envelope was used it could be verified that the correct assignment had been given. During the life of the experiment only five envelopes were utilized, with the verification process confirming that all treatments had been correctly assigned.

Although one would not expect such random assignment procedures to generate exactly the same number of cases in each treatment group, it would also be unlikely that great discrepancies would exist between the numbers in the three groups. The final number of cases in each of the three groups was close, with the randomization procedures generating 226 advise/separate, 240 citation, and 220 arrest cases.

The data in Table 5-1 give reason for confidence in the integrity of the randomization process. These data, obtained from Charlotte Police Department Offense Reports and Supplement Reports, as well as criminal history information, produce comparisons on 29 characteristics which might

have been responsible for an unknown bias in random assignment to treatment categories. Examination of these data reveal that the cases randomly assigned to the three treatments correspond closely on most dimensions, including such key background variables as race, age, and prior record. Moreover, as the statistical analysis shows, in 28 of the 29 comparisons there are no statistically significant difference between the three groups at or beyond the .05 level. Only one variable, "Living with the Offender", produced a difference in the three treatment categories that was significant beyond the .05 level. Citation cases were more likely than the others to involve offenders and victims who were living together.

## SECTION SIX

### CASEFLOW

It is vital in any experiment to have a sufficient number of cases to conduct meaningful analysis of the data. An adequate sample size allows sufficient statistical power (cf. Appendix D) to make legitimate statements about the results of data analysis. In this section, the flow of cases into the experiment is described.

#### Eligible Cases

Between the inception of the field test on August 8, 1987 and June 30, 1989 the project received a total of 686 eligible cases at the rate of almost exactly one case per day. The flow of cases fluctuated from week to week ranging from a low of 1 case per week to a high of 16 per week (see Chart 6-A). Saturdays and Sundays were the most active days, accounting for 38.6% of the eligible cases.<sup>1</sup> The hours of 6 P.M. to 11:59 P.M. likewise produced over 40% of the eligible cases.<sup>2</sup>

As expected, case flow varied from district to district. Prior to redistricting on January 4, 1989, Adam 2, Baker 2, and Baker 3 contributed the highest number of cases (92, 86, and 85 respectively; see Table 6-1). Adam 2 and Adam 3 produced the highest number of eligible cases after redistricting, contributing 28 cases each (see Table 6-2). Variations in numbers of eligible cases produced by a district can only be partially explained by differences in the volume of calls within different districts. As an examination of Tables 6-1 and 6-2 reveals, a number

of districts (especially Baker 3) appear to have contributed a percentage of eligible cases that is in excess of what might have been expected from their volume of domestic violence calls. Other districts, however, most notably Adam 4 before redistricting on January 4, 1989, and Charlie 1 after redistricting, appear to have produced less than expected.

During the course of this study approximately 550 officers were involved at one time or another in patrol duties. Due to normal attrition (internal transfers, injuries, illnesses, and retirement), some officers had little or no opportunity to produce an eligible case. It must also be noted that the majority of cases (96.2%) were answered by two or more officers.<sup>1</sup> However, only one officer completed the paperwork involved and thus received "credit" for participation. It is impossible to state accurately which officers did not contribute any cases.

The eligible cases were produced by a large number of officers. A total of 252 officers produced the 686 eligible cases, with 116 officers contributing one case, 48 officers 2 cases, 21 officers three cases, 21 officers four cases, and 46 officers five or more cases (see Table 6-3). The top three contributors produced 54 eligible cases, 7.8% of the total number.

Over the course of the project a number of actions were taken in an attempt to increase the caseflow. These measures included providing briefings and additional training for key police personnel, issuing departmental memoranda, and taking administrative action to promote greater cooperation from participating officers. Positive reinforcement was given to officers who contributed significantly to the project. This took the form of sending letters of commendation and appreciation to these

officers, and having appropriate entries made in their annual performance evaluation records. Officers who were active in responding to domestic violence calls, but who had not contributed eligible cases likewise received added attention. Thus, for example, in March 1988 all eight district commanders counseled one-on-one with officers who had answered eleven or more calls, none of which fell into the eligible category.

While some of this action may have contributed to temporary upswings in the flow of eligible cases, there was not at any time in the first year of the operation of the project a significant and sustained increase in the caseflow. At different stages prior to the implementation of the project very serious consideration had been given to utilizing an elite squad approach. After a site visit by members of the Project Review Team in December 1987, this approach was once again contemplated. Meetings with the police command resulted in an agreement that one more major effort would be directed at generating an increased flow of cases from the whole patrol force, but that if this were unsuccessful, elite squads would be established in two or three districts, preferably those that had the greatest disproportion between their volume of domestic violence calls and the contribution of eligible cases. This major effort resulted in a temporary upswing in the eligible caseflow (from an average of .77 cases a day for the period 1/9/88 through 3/4/88 to 1.4 cases a day for the period 3/5/88 through 3/25/88), but yet again failed to result in a sustained improvement as caseflow fell to .86 cases a day for the period 3/26/88 to 4/15/88 (see Appendix B).

As a consequence, it was decided that a special spouse abuse response team would be established in the three districts with the lowest ratio of eligible cases to calls for assistance in domestic violence cases. Three districts, Adam 2, Baker 2, and Adam 4 were asked to designate two of the

three officers in their respective districts who had contributed the highest number of eligible cases to the project. These teams were to operate with both officers in a special car from 7 p.m. to 3 a.m. five days a week. The car was to be designated as the primary unit for all domestic violence calls received during that shift. If the team was involved on a call when a second domestic violence call came through, it would act as back-up once the first call was cleared.

These teams began operation on April 26th and appear, initially at least, to have made a significant difference. The daily caseflow rate rose from .97 prior to implementation to 1.4 for the period 4/26/88 to 7/1/88. While the districts which received special squads contributed 33.8% of the eligible cases prior to implementation of these teams on 4/26/88, between 4/26/88 and 7/1/88 they produced 50.1% of the eligible cases. Thus, it appeared that the special squads were producing a desired increase in caseflow. However, by early July (7/1/88) assignment of officers to these squads became erratic and they eventually ceased to operate. This change was attributed by police personnel to Charlotte's increased crime rate (armed robbery, for example, rose 32.9% in 1988 over 1987) and the shortage of patrol officers (it was estimated that the department was 91 (18%) officers short on 12/31/88). Between 7/1/88 and redistricting on 1/4/89 caseflow averaged 1.03 cases per day.

With redistricting on 1/4/89 we anticipated that low caseflow might become particularly acute. Again, measures were taken to promote active participation by the officers. Letters of commendation were sent out to officers who had contributed significantly to the project and project staff addressed roll calls. These activities appear to have prevented any sustained downswing in caseflow, at least for the first three months after redistricting. Between 1/4/89 and 3/17/89 average daily caseflow was

1.05. Between 3/18/89 and the end of the project on 6/30/89, however, caseflow dropped to a rate of .69 cases a day. It is not possible to identify precisely the reasons for the drop in caseflow in the final months of the experimental phase. Since there was not a corresponding decrease in the number of calls for police assistance, we speculate that several factors, taken together, produced a situation in which officers became more reluctant to participate fully in the Spouse Assault Project. First, two shootings of black suspects by white police officers in February and April, 1989, received a great deal of adverse publicity which resulted in a strained climate for police officers and may have caused them to exercise extra caution. Second, increased crime rates and the shortage of police personnel undoubtedly continued to exert their impact. Third, in early March the project lost, as a result of ill health, the services of a retired police captain who had been the project's police liaison responsible for interacting daily on a one-to-one basis with police officers. Although a high priority was placed on filling this position, it was not possible to do so since suitable applicants could not be hired without losing some of their benefits. Finally, since it was well known that the project (whose end date had been extended twice) would terminate on 6/30/89, it can be assumed that some officers were following the natural tendency to wind down with the end of a project in sight.

#### Ineligible Cases

Between August 8, 1987 and June 30, 1989 the project received 2,694 ineligible cases. These were cases that involved spouse or cohabitant relationships, where there was probable cause to believe that a crime had been committed, but where one of the other twelve project eligibility criteria had not been satisfied.

As can be seen from an examination of Table 6-4, the major reasons for a case being ineligible were either that the suspect was gone on arrival, or that the victim insisted on arrest. While "suspect gone on arrival" was cited as one of multiple reasons for ineligibility in 53.3% of the ineligible cases, and as the sole reason in 44.3% of the cases, "victim insisted on arrest" was given as one of multiple factors in 29.6% of the cases, and as the sole factor in 18.5% of the cases. None of the other reasons were cited even as a multiple factor in as much as 12% of the cases.

The above data indicate that as anticipated, and in line with the findings of some of the other spouse replications projects, "suspect gone on arrival" accounted for about one-half of the ineligible cases. As discussed in the previous section, a validity check conducted in the pretest phase verified that the suspects were not on the premises when the officers arrived.

The initial problems with the "victim insists on arrest" category encountered in the pretest phase had resulted in the issuance of a memorandum on 7/31/87 by the Commander of the patrol division stating that if the victim insisted upon arrest the responding officers had either to make an on-the-scene arrest or transport the victim downtown to swear out a warrant. This administrative action brought about a decrease in the percentage of ineligible cases (42%) in which "victim insists on arrest" was cited in the pretest as a cause of case ineligibility. After this, follow-up action was taken with officers who cited this reason, but had not complied with the instructions contained in the memorandum.

A concern with the Charlotte project was that many otherwise eligible cases might be lost because of the stringent criteria required in the State of North Carolina for making warrantless misdemeanor arrests. As the data indicate, this was a factor in only a small percentage (7.9%) of the ineligible cases (see Table 6-4). This figure remained reasonably constant throughout the duration of the project.

A comparison of the ineligible cases with eligible cases reveals that there were a number of differences between the characteristics of the cases in the two groups. Most of the statistically significant differences that did exist could, however, be attributed to eligibility criteria. Thus, while all of the victims in eligible cases were female, and all of the offenders were male, 9.0% of the victims in the ineligible cases were male, and 8.5% of the offenders were female (see Table 6-5). In addition, the victims in the eligible case category were more likely than those in the ineligible case category to be living with the offender (86.4% v. 70.9%), and consequently more likely to be married (48.1% v. 38.6%) or cohabiting with the offender (42.7% v. 37.4%). Differences that did not appear to arise from eligibility criteria included the facts that eligible cases were somewhat more likely than ineligible cases to have been dispatched as 10-91s (79.9% v. 69.0%), and, perhaps indicating their more serious nature, were less likely to have only a single officer respond to the scene (3.8% v. 14.9%), and more likely to have victims who had been injured by their assailants (78.9% vs 70.9%).

### Misassignments of Treatment

Since the Charlotte project utilized the whole patrol force, we expected that a higher rate of misassignment of treatment would occur than if an elite squad had been employed. While it is not being suggested that a high rate of misassignment of treatment was tolerated, and every effort was undertaken to minimize the rate of misassignment of treatment, this factor should be borne in mind when examining these data.

Between August 8, 1987 and June 30, 1989, there were 113 misassignments out of a total of 686 cases for an overall misassignment rate of 16.5% (see Table 6-6). This misassignment rate declined somewhat after the earlier phase of the field test. In the first eight weeks there were 19 misassignments out of 79 cases for a misassignment rate of 24.0%. The next 91 weeks generated 94 misassignments out of a total of 607 cases for a misassignment rate of 15.5%.

Individual attention was directed to each misassignment of treatment with each officer sent a Request for Service form asking for justification for the deviation from the assigned treatment (see Appendix A, item # 4). There was never any intention to ask the officer to change the decision, to initiate any disciplinary action, or to imply that the officer had no right to deviate from the assigned treatment. The request was to solicit an "explanation" for the action.

Variables  
Elghcase, TRTASGN,  
and ACTLSGN

The common thread that ran through the fabric of responses to these forms was the defensive, almost hostile, attitude of the officers. This is not an atypical reaction. In fact, it may be perceived as a normal reaction when one sees that an infringement of one's discretionary powers is taking place. Officers argued, for example : "I was there. I know what was going on, and I was legal and justified in the action I took;" and, "How can you question my actions? You weren't there. You don't know what happened. There was reason to believe that if I followed what the computer said that Mrs. \_\_\_\_ would be left in imminent danger, and I wasn't going to be held liable."

Misassignments were for the most part distributed among members of the force, with a total of eighty-four officers accounting for the 113 misassignments of treatment. Sixty-one officers had a single misassignment, and nineteen had two.

Misassignments were not equally distributed across the three treatments: the misassignment rate for the arrest treatment was 9.1%; for the advise/separate treatment it was 12.8% ; and for the citation treatment it was 26.7%. Clearly, implementation of the citation treatment as randomized was not as high as for the other two treatments.

More specifically, misassignments were of four general types: Advise/separate treatments delivered as arrests (28 cases); citations delivered as arrests (43 cases); citations delivered as advise/separate (20 cases); and arrests delivered as advise/separate (17 cases). The treatment delivered in two misassigned cases resulted in a criminal summons. In one case, the suspect left before the responding officer could issue a citation. The other case involved an officer who had received an advise/separate treatment and transported the victim to the

<sup>4</sup> Source: Police OR/SR Reports: Jobfile- Mergestudy; Datafile- DJM/Merge/Output/070189; Variables- Elgbcase and Ofcrcode.

magistrate's office.

The movement from less severe to more severe treatment is underscored by the fact that the most common reason given for misassignment was "escalation of imminent danger" (52 cases). While "officer error" accounted for a small, but significant, number (9) in the first fifteen weeks, there were only 13 such cases in the following eighty-four weeks.<sup>5</sup>

In addition to the misassignments there were 37 cases in which there was misapplication of treatment. That is, a treatment was obtained and carried out, but it was later discerned that the case did not satisfy all eligibility criteria. Six of these cases involved situations where either the suspect or victim was under eighteen. These cases, which include one which was both misassigned and misapplied, have been counted as eligible cases (see Table 6-6). These cases all involved spouse-like situations where officers had made an understandable mistake regarding the age of the suspect or victim. They had all been treated as eligible cases, and the misapplication is the type that could be reasonably expected if a mandatory arrest policy were to be operationalized.

The remaining 31 cases were cases in which officers carried out the correct treatment assignment on non-spouse-like relationships. None of these cases have been included in the total of eligible cases, and all have been excluded from data analysis of experimental cases since the experiment focuses only upon spouse-like relationships. A total of 14 of these cases involved non-cohabiting boyfriends and girlfriends, four of whom were assigned the advise/separate, four the citation, and six the arrest treatment. The other cases involved siblings (4 cases), parents and children (4 cases), friends (2 cases), an ex-boyfriend and girlfriend (1 case), co-workers (1 case) and various other family relationships (5 cases).

## SECTION SEVEN

### TREATMENT CATEGORIES

This research is designed to measure the impact of three treatments on recidivism. For analysis to be meaningful, these three treatments as independent variables must be defined precisely and evidence presented that the unique elements of each treatment were delivered as designed. This section describes the three treatments as designed and the content of the three treatments as implemented and examines the integrity of the three treatment categories.

#### Treatments as Designed

The Charlotte experiment utilized three treatment categories which had both common and distinctive elements. As shown in Chart 7-A, the design of each treatment included three aspects: prescribed actions, optional actions, and proscribed actions.

The design of the arrest treatment required that an arrest be made of the suspect, that he be placed in custody, handcuffed, and taken before a magistrate. The design of the citation treatment required that the officer issue the offender a standard citation, and explain the citation to him. In addition, the officer could ask one of the subjects to leave if the officer deemed it necessary. The design of the advise/separate treatment required that the officer restore order and mediate the dispute. Mediation here refers to active involvement on the part of the officer in trying to negotiate a resolution of the immediate crisis. As with the citation treatment the officer could ask one of the subjects to leave and, with supervisor authorization, assist with transportation.

In all three treatments the officer was instructed to restore order and to give the victim an information card, which contained two specific items of information: the phone number of the shelter for battered women

CHART 7-A

6) Issue citation to appear in court	NO	YES	NO
7) Handcuff suspect	NO	NO	YES
8) Transport suspect to magistrate	NO	NO	YES

and the phone number for the Victims Assistance Program. Finally, in all three treatments the officers could refer the victim to any of a number of support agencies.

#### Treatments as Implemented

Descriptions of the content of the treatments as actually implemented in the field have been obtained from a number of different sources. These have included staff interviews of participating officers and sergeants, official reports filled out by the responding officers, and interviews of the victims themselves. As discussed later, victims were first interviewed a mean of 41 days after the presenting incident, with three-fifths of the interviews completed within 30 days (see Section 8).

The process of describing the actual content of the three treatments as implemented is not as straightforward as it might appear. First, as discussed in an earlier section, not all of the treatments were delivered as assigned. Thus, an officer may, for example, have begun to deliver an advise and separate treatment and then arrested the offender because of an escalation of imminent danger. Second, it appears reasonable to assume that officer and victim perceptions of what occurred at the scene will differ. The likelihood of such differential perceptions is heightened by the lack of victim familiarity with the different treatments being employed by the officers and by the fact that officers assessed that some 30.2% of the victims were under the influence of alcohol and/or drugs at the time of the presenting incident.<sup>1</sup>

In this section, the research data are presented in terms of the treatment that was randomly assigned to the case. This approach utilizes the computer verified classification of the assigned treatments and resolves difficulties in reconciling conflicts between officer and victim definitions of the treatment actually delivered.

(a) The Advise and Separate Treatment

Police. The interviews of participating patrol officers and sergeants provided the following description of the advise and separate treatment. After receiving treatment code #1, the responding officers (usually two officers responded) attempted to physically separate the victim and suspect, utilizing one officer with each of the involved parties. One officer would, if necessary, take the male into a room separate from the female to calm the situation down. Each of the parties involved was given the opportunity to tell the officer his/her side of the story. The officers then mediated the situation and attempted to help the couple settle their dispute. If the situation was still volatile, the officers would ask/recommend that one of the parties leave the residence. The female was given an information card prior to the officers leaving the residence. The average time taken to complete this process was estimated by the officers to be approximately forty minutes.

Analysis of the data provided by the responding officers on the spouse abuse supplemental report revealed that officers had to calm things down in 73.6% of the cases and gave counseling advice to the disputants in 67.5% of the cases (see Table 7-1). According to the officers, they were active in suggesting the victim seek outside assistance, recommending legal help in 55.9%, the women's shelter or a support group in 44.2%, and family counseling in 29.7%, of the cases. In 48.0% of the cases they referred the victim to the local victim assistance program. Finally, in 52.5% of the cases they asked or recommended that the suspect leave, and in 40.3% of the cases that the victim leave.

Victims. According to the victims themselves, the officers calmed things down in 80.2% of the cases and provided the couple advice on how to get along in 29.8% of the cases (see Table 7-2). Officers most often spoke

to victim and suspect alone, less often to the couple together. In 78.6% of the cases an officer spoke to the victim by herself, in 65.5% of the cases to the offender by himself, and in 43.8% of the cases to the couple together. In only 38.2% of the cases did the victims recollect being given a victim information card. However, in an additional 31.0% of the cases the victim said the officers provided information or a recommendation concerning legal rights, support groups, family counseling, or the women's shelter.<sup>2</sup> According to the victims the officers remained on the scene an average of 25 minutes.<sup>3</sup>

(b) The Citation Treatment

Police. According to the general description provided by the participating officers, after receiving treatment code #2, the responding officers would first calm the situation down. They then explained to the suspect (and victim) that he would be given a citation for the criminal offense that he had committed against the victim. One officer wrote the citation, gave the suspect his copy, and explained the citation to the suspect. The couple was told when to appear in court, and the victim was told that she would be expected to testify as to what happened in the confrontation with her partner. The suspect was asked to sign the officer's copy of the citation to prove that he received a copy and understood it. The victim was given an information card prior to the officers leaving the residence. This whole process, it was estimated, took approximately forty minutes.

2

Source: Initial Interview & Police OR/SR Reports; SAS Jobfiles - First, Second, and Fsmerge; Datafiles - Inter/data and Elig/data. The variable polhelp was constructed by giving it a value of 1 (yes) if "yes" responses were received for any of the following variables: Q150, Q152, Q153, Q154, Q155, Q156, Q157, or Q158. If "no" responses were received for all of these variables, polhelp was given a value of two (no). Polhelp was then crosstabulated with Q150 controlling for trtasgn. This process was repeated for the citation and arrest treatments.

3

Source: Initial Interview & Police OR/SR Reports; SAS Jobfiles - First, Second, and Fsmerge; Datafiles - Inter/data and Elig/data; Variables - Q170 and Trtasgn.

Data obtained from the police reports indicated that the responding officers had to calm things down in 71.5% of the cases and provided counseling advice to the disputants in 64.7% of the cases (see Table 7-1). As with the advise/separate cases, they were active in recommending outside help, and often asked the suspect and/or the victim to leave for awhile. In 61.5% of the cases the officers reported that the offender received the citation in the victim's presence, in 95.5% of the cases they believed that the offender understood the citation, and in 10.2% of the cases they stated that the victim argued against the offender being given a citation.

Victims. According to the victims, the officers calmed things down in 73.9% of the cases and provided the couple advice on how to get along in 35.3% of the cases (see Table 7-2). In 37.1% of the cases victims recollected being given a victim information card. In an additional 35.1% of the cases victims reported that officers gave victims specific advice or recommendations regarding legal rights, support groups, family counseling, or the women's shelter. A total of 63.9% of the victims stated that they saw or heard the officers give the offenders the citations, and 70.1% said that the officers explained what the citation required. According to the victims the officers remained on the scene an average of 29 minutes.

(c) The Arrest Treatment

Police. According to the participating officers, after receiving treatment code #3, the responding officers informed the suspect that he was under arrest for the criminal offense that he had committed against the victim. The suspect was normally handcuffed while still in the house and was frisked for weapons. The female was given an information card and the suspect was placed in the back seat of the police car and transported for an appearance before a magistrate. The officer obtained a warrant against the

Source: Initial Interview and Police OR/SR Reports; SAS Jobfiles - First, Second, and Fsmerge; Datafiles - Inter/data and Elig/data; Variables - Q170 and trtasgn.

suspect and completed the paperwork. This whole process was estimated in an informal survey of police officers to require approximately one hour.

Analysis of data obtained from the police reports revealed that officers had to calm things down in 58.9% of the cases, and provided counseling advice to the disputants in 47.5% of the cases (see Table 7-1). Both of these percentages, it should be noted, are significantly lower than those reported for both the advise/ separate and the citation cases. Likewise, officers reported being less likely in the arrest than in the other types of cases to recommend that the victim seek outside assistance, and were less likely to have helped the couple discuss their problems and work out a solution. Finally, officers reported that they handcuffed the offenders in 79.2% of the cases and that the victim argued against the offender being arrested in 24.1% of the cases.

Victims. According to the victims, the responding officers calmed things down in 69.9% of the cases and provided the couple advice on how to get along in 19.0% of the cases (see Table 7-2). The victim recollected being given an information card in 23.9% of the cases, and specific information and/or recommendations in an additional 34.5% of the cases. Offenders were, according to victims, handcuffed in 79.3% of the cases. The average amount of time officers remained on the scene was estimated by the victims to be 24 minutes.

#### Treatment Integrity

In an ideal experiment each treatment would be delivered in a uniform manner to each person. While such homogeneity would be maintained within each treatment, the treatments would be distinctly different from each other with the content of each treatment verifiable through precise measurement.

5

Source: Initial Interview and Police OR/SR Reports; SAS Jobfiles - First, Second, and Fsmerge; Datafiles - Inter/data and Elig/data; Variables - Q170 and Trtasgn.

In a field experiment like this one, however, we would expect to find variation in the following: (a) treatments as designed and treatments as delivered; (b) treatments as delivered by the same officer; (c) treatments as delivered by different officers; and (d) the delivery of treatments as reported by officers and as perceived by victims. In short, we would not expect to find the level of duplication in treatment responses in a spouse abuse field experiment that might be possible in other situations.

(a) Treatment Delivery: Comparison of Police and Victim Perceptions

As indicated previously, each of the three treatment responses required particular officer actions, some of which were common to all three treatments and some of which were unique to a specific treatment. All the treatments required that the officers calm down the situation where necessary. All three required that the officers give the victim a "victim information card".

As indicated in Chart 7-A, the advise/separate treatment required the responding officers to do three things: calm the situation down, provide a victim information card, and mediate/counsel/provide advice to the disputants. According to both police and victims, calming down the

6  
Other factors which diminish the likelihood of high levels of agreement between officers and victims may be briefly enumerated. First, our analysis has been consistently based on treatment as assigned. If a different treatment has been delivered, there is no reason to expect correspondence. Second, victim recall is always a potential problem in interview research. In cases where the interview is not obtained soon after the presenting incident, we would expect relatively poorer recall and a greater likelihood of incongruence between officer and victim reports. Third, victims under the influence of alcohol at the time of the presenting incident (30.2%) would have less accurate memories of the specifics of the police response. Fourth, the items presented in Table 7-2 are not exact duplicates of the information items completed by the police (Table 7-1). Incongruence in wording may have influenced a differential perception. Fifth, both victims and officers have the potential to misperceive what was actually said or done. Different observers will often perceive somewhat different aspects of the same phenomenon. In a field experiment investigating an emotionally charged abusive incident, there is some reason to expect that people will not perceive the event in identical ways.

situation was achieved the great majority of the time (73.6% and 80.2%, Tables 7-1 and 7-2). The second requirement was to provide a victim information card. This item was not included on police forms, and according to the victims approximately one-third (38.2%) stated that they had been given such a card (Table 7-2). Among women who stated that they had not been given an information card, more than one-half recalled that they had been given the information which was provided on the card. The third requirement for the advise/separate treatment was for officers to mediate the dispute. As shown in Table 7-1, slightly over two-thirds of the officers (67.5%) reported that they had provided counseling advice to the victim and her partner. Since mediation is a variable process, it is not surprising that victims report a diversity of actions. Approximately one-third (34.7%) of the victims reported that the officers had "tried to get (them) to work out their difficulties," 29.8% said that the officers had "provided counseling advice on how to get along."

The citation treatment also required officers to carry out three actions: calm down the situation, provide the victim information card, and issue and explain the citation (Table 7-A). The majority of both police and victims reported that the police had calmed down the situation (71.5% and 73.9%, Tables 7-1 and 7-2). This treatment also required distribution of the victim information card. Slightly over one-third (37.1%) of the victims interviewed stated that they had been given such a card (Table 7-2). Again, however, many more recalled being given the information provided on the card. As Table 7-2 indicates, one-third (36.4%) reported that they had been "provided information on women's shelters or support groups," one-sixth (15.4%) had been "referred to a victim advocacy program," and one-sixth (16.6%) said that the police had "recommended or

helped victim contact (the) women's shelter or support group." The third requirement for the citation option was to issue and explain the citation. The overwhelming majority (95.5%) of officers reported that the offender "appeared to understand" the citation (see Table 7-1). As indicated in Table 7-2, two-thirds of the victims interviewed said that they "heard the police give (the) offender the citation" (63.9%) and that the "police explained the citation" (70.1%).

The arrest treatment required responding police officers to carry out three procedures: calm down the situation, give the victim an information card, and handcuff the offender. The majority of both police and victims (58.9% and 69.9%) reported that the officer(s) had calmed the situation down, although for each group these were somewhat lower percentages than were reported for the other two treatments. The second requirement, that an information card be given to the victim, was particularly low in the arrest treatment. Less than one-fourth (23.9%) of the victims stated that they had been given such a card. Similar to the results reported for the other two treatments, many other victims reported that they had been provided comparable information on legal assistance or women's shelters (see Table 7-2). The first two requirements for the arrest treatment are, then, less likely to have been delivered than for the other two treatments (see Tables 7-1 and 7-2). We speculate that the following factors may help explain this result. First, the required procedures simply may not have been followed to the same degree as in the other treatments. Second, both officers and victims may have been more likely to have forgotten that such procedures were carried out. It is possible that the arrest treatment is by its nature more intense than either the advise/separate or citation treatments so that it overshadows other aspects of the situation. Finally, the arrest treatment required that offenders be handcuffed. As indicated in Tables 7-1

and 7-2, virtually identical percentages of both police (79.2%) and victims (79.3%) reported that the offender had been handcuffed.

The results presented in this subsection on treatment delivery suggest that the level of treatment integrity achieved in this experiment was lower than desirable but within acceptable limits. The myriad factors which mitigated a higher level of treatment integrity have been discussed previously; only one point requires additional attention, namely the degree of correspondence between officer and victim accounts of what happened.

(b) Police-Victim Perceptions: Synthesis

In order to explore somewhat more fully the correspondence between officer and victim reports of what transpired at the scene, five items with very similar wording between officer information forms and victim interviews were selected for a crosstabulation analysis.

Analysis of these items revealed the following. First, there is more congruence than incongruence between officer and victim reports; i.e., both officer and victim agree that a specific procedure was done or not done. For example, both agreed that the officer had "calmed things down," or both agreed that the officer had not "recommended a women's shelter or support group." Second, all items had some degree of incongruence; i.e. the police reported affirmatively but victims reported negatively, or the opposite. In such cases of incongruence, the general pattern is that police officers are more likely to have reported that a particular

7

These five items were (with police items listed first): (a) had to calm things down/calmed things down; (b) recommended family counseling /recommended or referred to family counseling; (c) recommended legal help/ recommended going to someone for legal assistance; (d) recommended women's shelter or support group/recommended or helped you contact any women's shelter or support group; and (e) referred to Victim's Assistance Program/ referred you to a victim advocacy program.

procedure was followed but victims stated otherwise.

More specifically, the highest level of police-victim congruence was found on the item "recommended family counseling" (70.0%).<sup>8</sup> The congruence level for "recommended a shelter or support group" was 65.8%.<sup>9</sup> Congruence on the other three items selected was very similar. "Referred to a victim advocacy program" had a congruence level of 60.2%;<sup>10</sup> "calmed things down" had a level of 59.7% congruence between officers and victims.<sup>11</sup> Finally, "recommending legal assistance" had the lowest level of congruence among the five items (59.0%).<sup>12</sup>

As noted above, all five items produced more congruence than incongruence, indicating that there is more agreement than disagreement between reports by police officers and interviews with victims. At the same time, there is sufficient disagreement in perceptions that additional analysis is planned.

### Conclusion

As indicated at the beginning of this chapter, each of the three treatments was characterized by three required actions, some optional police actions, and some actions which were unique to a specific treatment (e.g., issuing a citation with that treatment, handcuffing the suspect in the arrest treatment). Thus, the delivery of each treatment, while having

8

some common aspects (e.g., calming down the situation) had some differentiating characteristic which clearly set it apart from the other two treatments.

Treatment integrity, the degree to which treatments were consistently delivered as designed, has been a principal focus of this section. As the data indicated, there is ample evidence for two conclusions. First, police implemented the treatments as designed more often than not. Second, although there is a built-in commonality on some treatment actions, there is sufficient distinction between them to have confidence in the uniqueness of each treatment. When treatments were delivered as assigned, for example, no one in the advise/separate group was handcuffed and taken before a magistrate. Likewise, no one in the arrest group was issued a citation. In short, the treatments are each marked not only by what did happen, but also by what did not happen.

## SECTION EIGHT

### THE INTERVIEWS

The research design called for victims to be interviewed twice: first, shortly after the presenting incident; and a second time six months after the presenting incident.

#### The Questionnaires

The questionnaire for the initial interview was a lengthy document consisting of 546 variables (see Appendix A, item # 5). It sought detailed background information on the victim and integrated the core questions required of all the NIJ funded spouse abuse projects with issues unique to the Charlotte project. In particular, detailed data were gathered on the following: (a) the nature of physical violence directed against the victim, combining both core questions and the CTS Conflict Tactic Scale (Straus, 1979); (b) the history of the victim's marital and cohabiting relationships; (c) the nature of the presenting incident prior to the arrival of the police; (d) the actual actions taken by the police at the scene; (e) post-incident separations and reunions of the victim and offender; (f) recidivism since the presenting incident; (g) the victim's previous abuse history; (h) alcohol and drug use of both the victim and offender; and (i) the victim's help-seeking actions. The six-month interview, which consisted of 233 variables (see Appendix A, item # 6), focused primarily upon recidivism since the initial interview.

#### The Interviewers

The sensitive nature of the subject made it essential that quality interviewers be hired. Since it was suspected that male interviewers might make the female spouse abuse victims feel uncomfortable, only women were recruited as interviewers. A concerted effort was made to find women with good interpersonal skills. Women were recruited through

networking (i.e., known by interviewers or project staff to have the necessary qualifications), as well as by placing advertisements in a newsletter published by a local women's group. The interviewers came from varying backgrounds. They included social workers, counselors, real estate brokers, probation officers, housewives, and members of local women's groups.

After careful screening, potential interviewers attended a workshop during which they were familiarized with the interview schedule and received training in interviewing techniques. They were also advised in methods of tracking victims, an important issue since so many of the women in the study were in mobile, cohabiting, relationships. Tracking suggestions included utilizing next-of-kin information occasionally contained on police forms, and place of employment as well as residential information.

After training, interviewers were assigned cases on a weekly basis and attended regular supervisory sessions. At these sessions, the status of each case was reviewed, completed cases were turned in, and new cases were assigned. In addition, the interviewers discussed their experiences and the problems they had encountered in obtaining and conducting interviews, often done in extremely difficult situations.

#### The Process

After a case had been confirmed eligible, a letter was sent to the victim to introduce her to the project and ask for her participation. The letter asked her to contact the project office so that an interview could be arranged. If the victim did not respond to the first letter she received a second letter, follow-up phone calls, and follow-up home visits.

There is a necessary balance between aggressively soliciting interview cooperation and respecting women's rights. Greater emphasis on the former would undoubtedly have produced higher interview completion rates. Nonetheless, we chose to emphasize the rights of women to say no. Throughout the process the well-being of the victim was given high priority. We were concerned that no contact by the Spouse Abuse Replication Project put the victim in additional jeopardy. Special care was taken with regard to the letters: they were mailed to avoid weekend deliveries and did not specifically mention spouse abuse. In this way, the likelihood both of the offender intercepting the letter and of his becoming fully aware of our project purposes was minimized. Moreover, if he called the contact number, he still was not informed of the research focus since all phone calls were answered with the identifier "research office".

Special problems were presented by victims who had no phones and those who had moved from the location given at the presenting incident. Extra efforts expended on reaching these victims included contacting post offices and employers and next of kin (information provided on the Offense and Supplement Reports) for forwarding addresses. If these efforts were unproductive, interviewers went to the last known address and asked landlords and neighbors if they knew how to contact the victims. Victims without phones were the most difficult to contact. Interviewers left notes in mailboxes or with neighbors and scoured the neighborhood at various hours in the hopes of making contact.

Reimbursement rates were initially \$10/\$15 for both victims and interviewers depending upon where the interview took place. To increase the completion rates, payment was raised to \$35 for a victim who

was interviewed in her home and \$45 for the interviewer. When interviews were conducted at a neutral site chosen by the interviewer, the rates were reversed because it was seen as more of a burden for the victim to leave her home. Reimbursement rates for the six-month interviews were lower because these interviews were approximately half the length of the initial interviews. The victim received \$20 if the interview was conducted at the victim's home and \$25 if it took place at an interviewer chosen site. The interviewer received \$35 regardless of the location.

#### Interviewer contribution

As can be observed from an examination of Table 8-1, a total of 20 interviewers participated in obtaining the initial interviews. Twelve interviewers collected at least 10 interviews, while seven obtained 20 or more. Three interviewers accounted for 211 (50.4%) of the initial interviews.

The six month interviews were collected by 15 interviewers with eight obtaining at least ten, and six 20 or more. The top four interviewers accounted for 219 (67.6%) of the six month interviews. An effort was made to provide continuity for the victims by trying as much as possible to have the same interviewer conduct both the initial and six month interviews. Altogether, 247 (76.2%) of the victims who were interviewed twice were questioned by the same person.

#### Interview Completion Rates:

A total of 686 eligible cases were obtained during the course of the experiment, 646 of which were assigned interviews. Thirty-six of the 686 cases involved repeat victims who had already been assigned interviews. Four cases involved misapplications of treatment, and thus were not assigned interviews. Initial interviews were obtained in 419 of the 646 cases assigned for interview for an assigned interview completion rate of 65%. As

Sixmonth/data (variables = vidnum, Q230-interviewer ID)

can be seen from an examination of Table 8-2, there was little variation among the three treatments in interview completion rates. The mean number of days between the presenting incident and the initial interview was <sup>1</sup> 41.1 days, with 249 (59.4%) of the interviews completed in less than 30 days, 78 (18.6%) in 31 to 60 days, and 92 (22.0%) in 61 days or more.

Cases in which the victim refused to be interviewed, or which were dropped for other reasons, were kept active for a mean of 77.1 days before <sup>2</sup> efforts to interview were terminated. The most common reason for victim refusal, according to our interviewers, was fear of retaliation by the offender if he found out about the interview. Early in the project, and in consultation with women sensitized to the the dilemma of abused women, project staff made the operational decision to be cautious in pressuring abused women to be interviewed. When contact with women was first made, they were encouraged to participate, offered a variety of opportunities to do so securely, and guaranteed anonymity. It is possible that we adopted an overly-cautious approach, and it is uncertain what impact this had on the interview completion rates.

Interviews were dropped primarily as a result of inability to locate the victim despite the search efforts discussed earlier. In a few instances the interviewers decided to drop interviewees because the victim's alcohol/drug abuse problem made her answers incoherent.

As the above data indicate, victim interviews were not obtained in a sizable minority of the eligible cases. The generalizability of findings based upon the victim interviews could be affected by the extent to which cases in which interviews were obtained differ from those in which

interviews were not obtained. To test whether any significant differences existed between these two groups of cases, relevant victim, offender, and offense characteristics were compared. Since victims who had already been involved in eligible cases were not assigned second initial interviews, the 36 repeat cases were excluded from this analysis, thus producing a sample size of 650.

As can be seen from an examination of Table 8-3, few differences significant at the .05 level were observed between cases in the two groups. Victims who were interviewed did not differ significantly from those who were not interviewed on such key background variables as race, age, marital status, employment situation, and living arrangements, nor on any of the offense related variables examined. In only two areas were differences noted that were significant at the .05 level. Cases that produced interviews were less likely to have victims who (based on police reports) were under the influence of alcohol or drugs at the time of the presenting incident. In addition, interviewed cases were more likely to have offenders with prior state felony records. The impact of these differences upon the generalizability of findings obtained from the victim interviews is unclear. However, it may be surmized that the first factor may, in fact, have served to increase the reliability of the interview results. While the second factor may affect generalizations made about both the amount and the severity of repeat incidents, the preponderance of non-significant differences between those interviewed and those not interviewed allows some confidence in the generalizability of the interview results. The low interview completion rate does, however, affect statistical power.

Six month interviews were obtained from 324 victims for an assigned six month victim interview rate of 83% (see Table 8-4). The mean number

of days between the presenting incident and the six month interview was 199.7.<sup>3</sup> Cases for which six month interviews were not obtained remained active for a mean of 238.6 days.<sup>4</sup> As can be seen from an examination of Table 8-4, interview refusal was seldom the reason for not completing a six-month interview. Far more common was the dropping of interviews because of inability to locate the victims. If one recalls that approximately one-half of the eligible sample was represented by cohabiting couples, and that such couples are often in transitory relationships, it is not surprising that many women had moved since the first interview. Since former (and abusive) partners were not very helpful sources of information, and women very often do not leave change-of-address forms with the post office, tracking such cases was difficult.

The completion of 324 six-month interviews produces an overall assigned interview rate (both initial and six-month) of 50.2%. This completion rate is lower than expected or desired, and raises questions about the generalizability of the results of the interview data. We found few significant differences between those who were interviewed and those who were not. There are likely to be some differences that were not measured. Whether such hypothetical differences have influenced the results is a matter of speculation. Our data do not permit generalizations to all abused women who call the police because of our sample selection criteria. Results based only on interview data are most generalizable to women most comparable to those we were able to locate and successfully interview.

## SECTION NINE

### OUTCOME ANALYSIS: OFFICIAL RECORDS

Two different data sources were utilized to uncover acts of abuse perpetrated by the offender upon the victim subsequent to the presenting incident: official police records and victim interviews. In this section analyses based upon police records are presented.

All three levels of government (federal, state, and local) maintain records of offenders' criminal histories. However, the nature of the information kept at these three levels varies greatly. The most detailed and up to date arrest data are maintained at the local level. In addition, information on police-offender contacts which do not result in arrest is found only at the local level. Primarily for these reasons the decision was made to utilize local (city) police data sources for acts of abuse perpetrated by offenders subsequent to the presenting incidents.

The Charlotte Police Department maintains computerized records on all arrests made within city limits. Hard copies of all arrest, offense, and supplemental reports are kept by date of offense at the police department. Certified Police Information Network operators (i.e., licensed to operate this classified data bank) were employed by the project to conduct computerized record searches on all offenders involved in eligible cases. Operators first sought to determine if the offender produced an arrest record, and if so, they generated a copy of that record. Project staff then coded these records for specific variables (e.g., type of offense, date of offense). This information was then coded and entered into the project data files.

Although most offenders were easily traced, some problems did occur. For example, the same offender might appear in local police reports

with different birthdays, and/or first, or last names. To ensure that correct information was obtained on all of the offenders the following hierarchial search was conducted on each offender.

<u>Hierarchy for Identifying Offenders</u>	<u>Example</u>
1. same name and birthday	
2. same name with similar birthday	11/07/60 and 07/07/61 or 11/07/61
3. similar name with same birthday or same address	John A. Smith 11/07/60 Jack Smythe 11/07/60
4. different names - aliases supplied through state computer search or by Charlotte P.D.	Jack Smith = Andy Long = John Andrew = Andrew Allen = John Andrew Smith.

The same process was followed for each case and apparent matches were carefully checked on these and other items such as race, social security number and driver's license number to ensure that they involved the same offender.

#### Arrest Recidivism

##### (a) Definition and Operationalization

Arrest recidivism can be measured in a number of different ways. Decisions have to be made regarding the type of offense, the type of victim-offender relationship, and the time period that is to be included in the definition. Arrest recidivism can encompass, for example, any subsequent arrest or only a subsequent arrest for a violent crime. It can include any offense committed against any victim or only offenses committed against a specified victim. Finally, the follow-up period can be for any specified amount of time.

In this study, arrest recidivism is operationalized as follows:

**Arrest Recidivism: Any arrest for any subsequent offense by the same offender against the same victim committed within six months of the presenting incident.**

Although most of the offenses committed by offenders constituted assaults against the person, this operational definition is not so limited and includes a variety of other offenses such as criminal trespass and damage to property.

This operationalization does not include a subsequent arrest made on the basis of an offense committed during the presenting incident. Thus, for example, if after an advise/separate treatment had been assigned and delivered, the victim swore out a warrant and had the offender arrested for an offense committed during the presenting incident, this would not be included as arrest recidivism.

Likewise, arrests for procedural matters are not included as arrest recidivism. Thus, if after a citation treatment had been assigned and delivered, and a subsequent order for the offender's arrest was issued and served based on his failure to appear for court proceedings as mandated by the citation, this would not count as arrest recidivism.

To reiterate, a subsequent arrest is not defined as recidivism unless the arrest was based on the commission of an additional offense by the same offender against the same victim. To illustrate how these procedures were applied three hypothetical situations are presented which involve an offender whose presenting incident was on 1/1/89.

(i) The offender is arrested on 3/1/89 for a subsequent offense against the same victim. He is released on bail but fails to turn up for court proceedings on 4/1/89. An order for his arrest is issued and served on 4/3/89. His rap sheet shows two arrests subsequent to the presenting incident for offenses against the same victim. However, since the two arrests relate to the same incident (3/1/89) there is only one incident of arrest recidivism. The date of arrest recidivism is 3/1/89.

(ii) The police are called to the defendant's home on 3/1/89 to deal

with an incident between him and the same victim. The police advise the couple and leave. No further action is taken on this incident. Here there is no arrest recidivism because there is no arrest.

(iii) Same as (ii) except that on the day after the police have responded the victim goes downtown, swears out a warrant, and has the suspect arrested. Here we have an arrest on 3/2/89 based on an incident committed on 3/1/89. Since there is a subsequent arrest based on a subsequent offense committed by the same offender against the same victim, there is arrest recidivism. The date of arrest recidivism is the date on the subsequent offense (3/1/89), not the date of the arrest (3/2/89).

It should be stressed that since the subsequent offense must have been committed against the same victim, subsequent arrests for offenses committed against other victims (e.g. assaults on employers, parents, neighbors or others) and subsequent arrests for "victimless" crimes (e.g. possession of drugs, drunk and disorderly) are not included as arrest recidivism. Finally, it was decided that no more than one failure per day should be counted.

The 686 eligible cases involved 650 different offenders necessitating the acquisition of a total of 650 offender criminal histories. In each of the 36 cases where an offender re-entered the experiment with a new offense, these incidents were processed as repeat offenses. The second incident was not counted as a new case.

(b) Outcome Analysis Procedures: Prevalence, Incidence, Time to Failure

The analysis of main effects focuses on three aspects of arrest recidivism: prevalence, incidence, and time to failure. Prevalence of failure concentrates on whether or not a subject failed and is defined as the percentage of cases (offenders) that had at least one failure (a repeat arrest for a subsequent offense against the same victim) within a

specified time period (six months). Incidence focuses on the number of times a subject fails and is defined as the mean number of failures per case within a given treatment group. Time to failure, finally, focuses on the duration of the specified follow-up period and examines when, as well as if, the offender recidivates. All primary analyses, it should be noted, were conducted on treatments as assigned.

In determining whether prevalence rates differed significantly between the treatment groups, the chi square statistic was utilized. The number of subsequent arrests, was collapsed into two categories (0 = No subsequent arrest, 1 = at least 1 subsequent arrest), and was crosstabulated with the treatment assigned. The resulting chi square serves as the basis for determining whether prevalence of subsequent arrests is significantly different across the treatment categories.

Next, in order to test the null hypothesis that the mean subsequent arrest incidence rates were the same across treatment groups, analysis of variance was employed. For rejection of the null hypothesis, the alpha error probability level was set at 0.05; i.e., if statistical analysis produces a significance level at or below 0.05 we conclude that some statistically significant difference exists between at least two of the three treatment groups. However, the F-ratio does not indicate between which pairs of treatments a significant relationship exists, and it becomes important to ascertain where significant differences exist. For example, can advise/separate rates be interpreted as being significantly different from citation or arrest rates, or can arrest rates be interpreted as being significantly different from citation rates, or are all three different from one another? The primary concern, then, after obtaining a significant F-ratio is discovering where differences emerge.

As the number of independent statistical tests of significance increases "the probability of at least one significant chance result is  $1-(1-\alpha)^c$ , where  $c$  is the number of significance tests performed" (Stavig, 1978, pp. 199-200). As such, it would be inappropriate to perform multiple t-tests since the essential "problem is that when many comparisons are made, some will appear to be significant even when all population means are equal" (Norusis, 1988, p. 119). To control for this potential problem while retaining the power to ascertain differences between individual pairs of groups Norusis (1988) and Stavig (1978) suggest the use of a multiple range comparison procedure. As Norusis (1988) states, "Multiple comparison procedures protect against calling too many differences significant. These procedures set up more stringent criteria for declaring differences significant than does the usual t-test" (p.119). One such procedure, the Scheffe multiple range comparison for pairwise contrasts is one of the most commonly utilized range tests (Nie, et al, 1975, pp. 429-430).

Incidence analyses herein, then, were evaluated with analysis of variance and, if the obtained F-ratio was statistically significant ( $\alpha \leq 0.05$ ), the treatment groups were compared with each other to determine which groups were significantly different from one another (Norusis, 1988, pp. 119-120).

The analysis of time to failure was facilitated by the use of SPSS version 9 subprogram SURVIVAL (Hull & Nie, 1981, pp.205-210). Nonparametric life tables were generated for one-week intervals extending from the time of the presenting incident to 180 days after the presenting incident. Utilizing the Berkson and Gage (1950) estimate of cumulative survival rate, the total proportion of subjects surviving at the end of each one week interval can be computed (Hull & Nie, 1981). In addition,

the software provides an accompanying test statistic (Lee-Desu D) which can be utilized to determine whether the survival rates differ across the three treatment groups for the 180 day follow-up period. Lee-Desu D is distributed as a chi square random variable with  $k-1$  degrees of freedom<sup>1</sup> (where  $k$  = the number of treatment groups) .

The time to failure analysis includes an estimate of Lee-Desu D, the probability of alpha error value, estimates of the cumulative proportion of subjects surviving at the end of each one-week interval, and a graphic display of the estimated cumulative survival curves. Such an analysis is of benefit in examining both the individual and comparative failure rates of the three treatment groups over time.

(c) Outcome Analysis: Prevalence and Incidence Results

The prevalence and incidence of arrest recidivism for the three treatments during the six months after the presenting incidents are reported in Table 9-1. These analyses were conducted on the treatments as assigned.

Prevalence of failure is defined as the percentage of cases (offenders) that had at least one failure (a repeat arrest for a subsequent offense against the same victim) within the specified time period (six months). As can be observed from an examination of Table 9-1, the prevalence of arrest recidivism for the total sample was 16.5; that is, 16.5% of all offenders had at least one repeat arrest within six months of the presenting incident. Examination of the data in Table 9-1 indicates a prevalence rate of 18.2 for the arrest treatment, 11.8 for advise/separate, and 19.2 for the citation treatment. Statistical analysis of the prevalence rates provides no evidence that there are real

1

Lee-Desu D is the default test statistic for subprogram SURVIVAL in SPSS Version 9 software. Comparable test statistics in other software packages include the Mantel-Cox test (Dixon, et.al., 1985) and the log-rank and Wilcoxon chi square tests (SAS Institute, 1985).

differences among the three treatments. Thus, arrest is no better at deterring failure than the other two treatments.

The vast majority (76.4%) of the crimes for which offenders were rearrested were for assaults against the victim. There were no significant differences between the three treatment groups in the types of offenses for which rearrests took place.<sup>2</sup>

Incidence is defined as the average number of failures per case within a given group. As shown in Table 9-1, the incidence rates of arrest recidivism for the total sample was .195; that is, the average number of failures (repeat incidents resulting in arrest) was .195 per person. Examination of the data in this table shows an incidence rate of .201 for those in the arrest treatment, .123 for offenders in the advise/separate treatment, and .259 for those in the citation treatment. Analysis of variance conducted on these incidence rates produced an overall F ratio significant at the .05 level. However, Scheffe Multiple Range Comparisons yielded significance at the .05 level only for the advise/separate - citation comparison (see Table 9-2). Again, the arrest treatment does not produce significantly lower incidence rates than either of the other two treatments. Thus, in comparing rates of failure as measured by incidence, arrest is apparently better than the citation treatment but apparently worse than the advise/separate treatment. However, arrest is not significantly better or worse than these other two treatments at statistically acceptable levels.

We interpret these results to indicate that arrest is no better at statistically significant levels in reducing either prevalence or

2

incidence of failure. There is some indication that the advise/separate treatment is more effective than the citation treatment at reducing subsequent recidivism on the part of the offender.

In order to examine more fully the effect of the advise/separate treatment, and to control to some extent for misapplications of treatment (38.1% of the misapplications were citations delivered as arrests), analysis was undertaken of the informal versus the formal treatments. This task was accomplished through the use of pairwise Scheffe comparisons of the informal (advise/separate) versus the formal (citation and arrest) treatments. The Scheffe approach includes a provision for combining treatment groups for the purpose of comparing the aggregated group to the other treatment groups (Fleiss, 1986, pp.54-57). Consequently, the technique appears to be very well suited for this sort of comparison.

The test statistic for the comparison is essentially a ratio of the raw contrast to the standard error of the contrast. The resulting value is then compared to a critical value which is functionally related to the F-ratio for the model (Fleiss, 1986, pp.54-55). If the contrast ratio, usually referred to as an L-ratio, exceeds the critical value, the null hypothesis that the aggregate mean score is equal to the other treatment group's mean score is rejected at the specified significance level (0.05 in this analysis).

The analysis indicated that the informal response was indeed more successful at deterring subsequent abuse, as can be observed in Table 9-2. As is also evident from the table, the contrast between arrest and non-arrest (advise/separate and citation combined) was not statistically significant at the 0.05 level.

\* Critical L =  $\sqrt{(g-1) (\text{Critical } F)}$  where g = the number of treatment groups and the Critical F is the F-value required to reject the hypothesis that all group means are equal with 2 and 647 degrees of freedom at the 0.05 alpha error probability level.

(d) Outcome Analysis: Results of Additional Analyses of Prevalence and Incidence Rates

The primary analyses of official recidivism have been conducted by operationally defining official recidivism as arrest recidivism, utilizing treatment as assigned as the independent variable, and conducting the analyses on the 650 dyads that produced eligible cases without taking into account relevant background variables. In this subsection we examine the results obtained by (i) taking into account race, record, and other such variables; (ii) conducting the analyses on samples that are theoretically important, but different from the basic sample of 650; (iii) utilizing treatment as delivered as the independent variable; and (iv) operationalizing official recidivism as contact recidivism.

(i) Analyses on Treatment as Assigned Taking into Account Race, Record and Other Such Variables

This analysis takes into account such offender-related variables as race, age, employment status, and prior record, such victim-related variables as race, age, employment status, and victim-offender relationship, and such incident-related variables as the location of offense and the infliction of injury and/or property damage. By "taking into account" we mean that the variables were incorporated in a simple additive regression model. Such analyses are often more powerful than simple analysis of variance that does not take the variables into account.

The variables found in this analysis to be most highly predictive of arrest recidivism are those relating to the offender's prior record (variables such as possession of a state [felony] prior record, possession of a local [felony/misdemeanor] record, and number of prior non-traffic arrests within the preceding five years). Analyses of prevalence and incidence rates controlling for these variables yielded no evidence that

the treatments differ.

(ii) Analyses Based on Sample Sizes Other than the Basic Sample

As discussed earlier in this section, all primary analyses on arrest recidivism have been conducted on a sample size of 650. While the authors consider this sample to be the most appropriate for the analyses undertaken, they acknowledge that arguments may be raised in favor of examining other samples.

First, it may be argued that instead of treating repeat cases as treatment failures they should be counted as new cases, although this violates the assumption of independence. Since there were 36 repeat cases in this study this would raise the sample size to 686. Second, it may be argued that cases that entered the experiment during the last six months of operation should be excluded from analyses of arrest recidivism. This is because operational procedures changed on 6/30/89 when the last eligible case was collected and eligible cases were no longer randomly assigned to the three treatments. With the exclusion of the cases that entered the experiment in the last six months we are left with a sample size of 513. Third, it may be argued that analysis should be conducted solely on cases that were assigned and delivered the same treatment. A total of 545 of the 650 eligible cases were delivered the treatment they had been assigned.

4

Analysis of these cases (N=545) and of repeat cases treated as new cases (N = 686) produced results that were insignificant at the .05

level. That is, neither of these analytical approaches showed statistically significant differences in arrest recidivism between the three treatment groups. Analysis of all cases except those that entered the experiment during the last six months (N = 513) yielded results similar to those obtained by the primary analysis of arrest recidivism for the sample of 650 by treatment assigned. Paralleling the results of the primary analyses, this analysis produced findings of significance at the .05 level only for analysis of variance conducted on the incidence rates, and for the Scheffe comparison test between the advise/separate and citation treatments.

(iii) Analyses Based on Treatment as Delivered

Primary outcome analyses were conducted on treatments as assigned. This yielded the most unambiguous results relative to statistical standards. However, since not all of the treatments were delivered as assigned, it was considered worthwhile to examine the results obtained by utilizing treatment as delivered as the independent variable. Prevalence and incidence analyses conducted utilizing treatment as delivered as the independent variable yielded results that were insignificant at the .05 level.

(iv) Analyses Defining Official Recidivism as Contact Recidivism

Contact recidivism may be generically defined as any subsequent interaction between the police and the victim which involves a complaint against the offender. As has been discussed earlier in Section Four, however, the vast majority of domestic calls to which the police respond involve situations in which the police determine that there is no probable cause to believe that a crime has been committed, and consequently minimal

6

Source: Jobfile: CRSTUDY, Datafile: S/C/H; Variables: Q2A, Q44, Q4A  
(year value: cases with year values less than 89 were selected)

(if any) information is recorded concerning what has transpired between the victim and the offender. Since these non-probable cause cases do not generate sufficient information for analysis, contact recidivism has been limited in this study as to include only subsequent interaction between the police and the victim in which the police determine that there is probable cause to believe that the offender has committed a subsequent offense against the victim. The interaction may result in the arrest of the offender, but it may end in the matter being resolved in some other fashion, as by the police advising the couple.

Contact recidivism is of relevance here in two different ways. First, repeat offenses which generated eligible cases may have been randomly assigned the advise/separate or citation treatment, and thus not been counted as instances of arrest recidivism. However, it may be argued that counting these repeat incidents as contact recidivism, and not as arrest recidivism, is misleading because they would have resulted in the arrest of the offender had the experiment not been in operation. Thus, all repeat eligible cases should be counted as incidents of arrest recidivism. To meet this argument the data were analyzed counting as failures all repeat eligible cases (whether assigned the advise/separate, citation, or arrest treatment). This analysis produced results that were insignificant at the .05 level.<sup>7</sup>

Second, analyses were conducted utilizing contact recidivism as the measure of official recidivism in all cases. Information on subsequent offender-police contacts that did not result in arrest was obtained from the supplemental domestic violence and offense reports filled out by

7

Source: Jobfile: CRSTUDY, Datafile: S/C/H; Variables: Vidnum, Q2A, Q44

officers on all probable cause cases involving couples with spouse-like relationships. However, since the supplement report was discontinued at the end of the field test stage on June 30, 1989, this information was not available for the six month follow-up period for cases that entered the project during the last six months of field operation.

Analyses of this police contact data conducted both on all eligible cases and all eligible cases except those that entered the experiment in the last six months showed prevalence and incidence rates of contact recidivism to be extremely close, and consequently insignificant at the .05 level.<sup>8</sup> That is, based on "contact" as operationally defined above, none of the three treatments produced significantly different consequences.

(e) Outcome Analysis: Time to Failure

The rates of prevalence and incidence of arrest recidivism were calculated for the follow-up period of six months and measure whether any of the treatment responses were significantly more effective at deterring subsequent recidivism. These measures are not, however, sensitive to significant fluctuations in the relative effectiveness of the three

8

Prevalence rates for contact recidivism by treatment assigned for all eligible cases were: 11.3 for those assigned the advise/separate, 12.5 for those assigned the citation, and 10.8 for those assigned the arrest treatment (chi square = 0.344; df = 2; p = 0.842). The incidence rates were: .118 for those assigned the advise/separate, .138 for those assigned the citation, and .136 for those assigned the arrest treatment (F = .170; df (1) = 2, df(2) = 647; p = .843).

Analyses conducted on all cases except those that entered the experiment during the last six months of operation produced the following results: Prevalence rates of 13.4 for separate/advise, 15.1 for citation, and 13.0 for arrest cases (chi square = 0.367; df = 2; p = 0.833), and incidence rates of .140 for the advise/separate, .168 for the citation, and .164 for the arrest treatments (F = .200; df(1) = 2, df(2) = 510; p = .821)

Source: Jobfile: CRSTUDY, Datafile: S/C/H; Variables: Vidnum, Q2A, Q66, Q4A (year value)

treatments that may occur during the six month period. It may be the case, for example, that arrest has an immediate deterrent effect (e.g. one month) but in the long term (e.g. six months) has no greater deterrent effect than the other two treatments. In order to identify such time fluctuations in deterrence, survival analysis was conducted on the data.

The survival experiences of the different treatment groups are presented in Graphs 9-1, 9-2, and 9-3. Graph 9-1 presents the survival experiences of the subjects in the three treatment groups taken separately. Graph 9-2 compares the survival experiences of those assigned the arrest treatment with those assigned the citation or advise/separate treatments. Finally, Graph 9-3 contrasts those assigned the formal (citation or arrest) treatments with those assigned the informal (advise/separate) treatment.

As can be observed from an examination of these graphs, at no time is the arrest treatment more effective in deterring subsequent abuse than the other two treatments. In fact, there are no significant differences in the survival experiences of offenders assigned any of the three treatment responses (Graph 9-1) or between those assigned the arrest treatment and the other two treatments (Graph 9-2). Initially (for the first three weeks) the arrest treatment appears slightly more effective than the combined advise/separate and citation treatments (Graph 9-2). However, these differences are very small and the trend is not sustained.

It is only when the survival experiences of those assigned the informal as opposed to the formal responses (Graph 9-3) are compared that significant differences emerge. Beginning with the first week (after the presenting incident) the advise/separate treatment (informal) continually has a higher cumulative proportion of survivors than the formal (citation

and arrest combined). However, it is after week fifteen that the difference between the two groups begins to grow, rising from a difference of 3.0% in the cumulative proportion of offenders surviving in the two groups after 105 days to a difference of 7.3% at the end of the six months. This difference is significant at the .05 level.

It is important to view this difference with considerable caution. Nearly all of the statistical analyses we conducted failed to detect any significant difference between the treatments. Furthermore, the great majority of women have not been victims of a repeat incident within the six-month follow-up, and the differences which do exist between the treatments in terms of time to failure are in our judgment not substantively significant. These findings in no way would justify police moving to an informal response to spouse assault as the preferred action.

(f) The Effect of Utilizing Different Measures of Arrest Recidivism

Although we have described above the primary measure of arrest recidivism employed in this study, it is instructive to examine the extent to which findings are affected by the use of alternative approaches. In this subsection we investigate recidivism prevalence rates for the three treatments based on five different definitions in order to clarify the operationalization of arrest recidivism.

Five different operational definitions are examined, all of which utilize the six month follow-up period. The first three are measures of recidivism that include arrests for offenses that were committed against any victim. The last two definitions include arrests only for offenses committed against the same person who was the victim in the presenting incident. Listed in order from the most general to the most specific,

these operational definitions are as follows: (1) any subsequent arrest for any offense; (2) any subsequent arrest for any crime of violence against the person (e.g. assault) or property (e.g. damage to property); (3) any subsequent arrest for any crime of violence against the person; (4) any subsequent arrest that involved the same couple; and (5) any subsequent arrest that involved the same couple but did not include subsequent arrests relating to the presenting incident as, for example, when an order for arrest had been issued for the offender's failure to appear to answer the citation given at the presenting incident.

As can be seen from an examination of Table 9-3, the relative effectiveness of the three treatments in deterring subsequent recidivism is affected by the operational definition chosen to measure arrest recidivism. Thus, for example, when the broadest definition of arrest recidivism is utilized (any subsequent arrest whatsoever) the citation treatment produces the lowest rate of recidivism. However, when the narrowest definition of arrest recidivism (same couple excluding presenting incident) is taken the citation treatment produces the highest rate of recidivism. However, it must be emphasized that none of these differences are statistically different at the .05 level.

The importance of selecting a suitable operational definition of arrest cannot be overemphasized. The theoretical framework of this study necessitates excluding arrests for so called victimless crimes, such as the unlawful possession of drugs, and arrests for offenses against victims other than those in the presenting incidents. Since we are attempting to measure the effectiveness of different treatment responses in deterring subsequent abuse against spouses and cohabitants, it is not logical to

count as failures subsequent arrests for "victimless" crimes or for offenses committed against other victims, such as employers or strangers.

This study has, as discussed above, limited the primary operational definition of arrest recidivism to subsequent offenses committed by the same offender against the same victim. A key element of this definition is the the need for commission of a subsequent offense. Here it is imperative that we stress once again the importance of thoroughly examining the nature of each subsequent arrest. If our official record search shows that the offender was arrested on a date subsequent to the date of the presenting incident for an offense involving the same victim, and we conclude on that basis that arrest recidivism has occurred, we may be making a fundamental mistake. The arrest may have been made as a result of a procedural issue arising from the presenting incident, and not as the result of the commission of an act of further abuse by the offender against the victim. This would be the case if, for example, an arrest warrant had been issued against the offender for failure to appear to answer the citation issued at the presenting incident; this situation occurred in four cases in this study. This type of subsequent arrest would be an indication of a failure of the citation as a process for securing the appearance of the offender before the court, and not the failure of the citation as a treatment response since no subsequent act of abuse had occurred.

(g) Outcome Analysis: Summary of Results

Data in the preceding subsections do not support the hypothesis that arrest is better at deterring additional abuse than either an advise/separate procedure or the utilization of a citation. Examination of prevalence, incidence and time to failure consistently failed to reveal

any substantive or statistically significant differences in favor of arrest. The importance of these findings will be discussed more fully in a subsequent section of this report.

## SECTION TEN

### OUTCOME ANALYSIS: VICTIM INTERVIEWS

In the preceding section we presented the results of outcome analyses based on an examination of police records. In this section we focus on outcome measures obtained from victim interviews. Since it is known that a large proportion of abuse victims do not call the police,<sup>1</sup> and most of those who do call the police do not do so for every abusive incident, victim interviews provide a different measure of actual abuse than official police data.

As discussed previously, an attempt was made to interview victims at two time periods: first, soon after the presenting incident and second, six months after the presenting incident. The two interviews are mutually exclusive. The initial interview focused on episodes of abuse which occurred between the time of the presenting incident and the interview. The six-month interview included only incidents occurring since the time of the first interview. In both of these interviews victims were asked questions that explored whether there had been further abusive incidents. More specifically, each victim was asked about six types of victimization, namely whether the offender had: (1) threatened to hurt her; (2) actually hurt or tried to hurt her; (3) threatened to hurt any member of the family; (4) actually hurt or tried to hurt any member of the family; (5) threatened to damage property; and, (6) actually damaged any property. Victims were asked to estimate how often each type of victimization had occurred and were posed more detailed questions on the first and most recent occurrence of victimization.

<sup>1</sup> see e.g., Langan & Innes, (1986, p.3); Rose & Goss, (1989, p.7)

Prevalence and incidence rates, and accompanying statistical analyses, have been conducted in two ways. First, following the example of Dunford, et al. in the Omaha study, we have included non-interviewed cases along with those interviewed in order "to allow for examination of the effect of missing data on the experimental design" (Dunford et al., 1989, p. 32). Those not interviewed were considered not to have been the victims of subsequent abuse. Since the prevalence and incidence rates are based on the total number of victims in each treatment group, regardless of whether they were interviewed, the resulting rates are artificially low. Second, analyses were conducted excluding non-interviewed cases. This provides a more accurate measure of prevalence and incidence for those women actually interviewed.

#### Outcome Analysis: Prevalence and Incidence of Recidivism

The prevalence rates of victim reported recidivism for the initial and six month interviews are presented in Tables 10-1 and 10-2 respectively. In both interviews the types of recidivism reported most frequently by victims were threatened to hurt and tried to hurt, or actually hurt the victim. These two items accounted for 179 (65.1%) of the 275 reports of recidivism in the initial interviews, and for 199 (57.2%) of the 348 reports of recidivism disclosed in the six month interviews.

As can be seen from an examination of Tables 10-1 and 10-2, no statistically significant differences between the three treatments were obtained for any of the six measures of recidivism examined in either the initial or the six month interviews. Thus, arrest is no more effective than the other two treatments at deterring offenders from committing any of the six types of abusive acts under consideration. The one measure that registered close to statistical significance at the .05 level in the initial interviews, hurt other family member, involved only eight incidents,

Source: Sixmonth Interview & Official Police Records; Jobfiles - First, Second, & Fsmmerge (SAS); Datafiles - Sixmonth/data & Suspect/Criminal/History; Variables - Q30, Q34, Q38, Q42, Q46, Q50, Q233, and Q2A.

six of which were for cases assigned the citation treatment. As the data in Table 10-2 show, this finding was not statistically significant for the six month interviews, and when the analysis was repeated for the initial interviews without using missing data as an outcome, the p. value obtained increased from .053 to .073.

Given the far longer follow-up period covered by the six month interviews, the lack of any finding approaching a significant difference between the three treatments is noteworthy. Indeed, the lowest p. value obtained for any of the six measures was .523. The two types of recidivism reported most frequently by victims, threatened to hurt and tried to hurt, or actually hurt the victim registered p. values of .912 and .301 respectively.

Thus far, our analysis of victim reported recidivism has focused on the six measures of recidivism taken individually. Since it was possible for a victim to report the occurrence of more than one type of repeat incident, it is conceivable that a small number of cases with different types of repeat incidents was unduly affecting the overall picture of victim reported recidivism obtained by examining the six measures separately.

The desirability of constructing a composite measure of recidivism is augmented by the fact that high levels of recidivism were reported in both the initial and the six month interviews for only two of the six measures of subsequent abusive incidents: offender threatened victim, and offender hurt, or tried to hurt victim. A composite measure of recidivism was obtained by summing the responses to the screen questions for the six types of victimization; i.e., any occurrence of any of the six measures of abusive incidents. The results for both the initial and six month interviews are presented in Tables 10-3 and 10-4. Prevalence and

incidence rates, and accompanying  $\chi^2$  tests of significance, are presented with non-interviewed cases treated first as outcome measures in the analyses, and then with these cases excluded from the analyses.

Analysis based on these composite measures of rates of recidivism shows that there are no significant differences between the three treatments (see Tables 10-3 and 10-4). With lower prevalence and incidence rates than the citation response, and for the most part higher rates than the advise/separate response, arrest is neither any more effective, nor any less effective, than the other treatments at deterring subsequent abuse.

Since the data in Tables 10-3 and 10-4 are mutually exclusive, and it is important to obtain a complete accounting of all acts of recidivism for each case for the full follow-up period, data obtained from the initial interviews were combined with data from the six month interviews. Since 14 initial interviews were conducted at or around the six month mark (see ante, Table 8-4), these 14 cases were added to the 324 cases for which six month interviews were obtained to produce a final sample size of 338. Since few cases had their second interview exactly six months after the presenting incident, there is some variation among cases in the length of the follow-up period. However, there was little difference between the three treatment responses in the mean number of days between the presenting incident and the six month interview.<sup>1</sup>

<sup>1</sup> The mean number of days between the presenting incident and the six month interview for the three treatments were: Advise/separate 205.04 (s=45.78); Citation 198.18 (s=35.88); Arrest 194.79 (s=34.03).

Table 10-5 presents the prevalence and incidence rates of total victim reported recidivism for the cumulative-composite initial and six month interviews. Consistent with the findings reported thus far on victim reported recidivism, there are no significant differences between the three treatments in subsequent victim reported incidents. Indeed, the prevalence rates for the advise/separate and arrest responses are so close that their rank order shifts depending upon whether non-interviewed cases are included in the analysis. When non-interviewed cases are included in the analysis, the advise/separate response has the lowest prevalence rate, when the same cases are excluded the arrest response has the lowest rate. These differences are, however, extremely small and in no case do they approach statistical significance.

The pattern of statistically insignificant findings was maintained when treatment categories were combined. The comparison between the arrest treatment and the other two combined produced results that were insignificant at the .05 level (see Table 10-6), as did the formal (arrest and citation combined) versus the informal (advise/separate) dichotomy (see Table 10-7).

#### Outcome Analysis: Time to Failure

Survival analyses were performed on the cumulative-composite initial and six month interviews (N=338). The survival rates for the 180 day follow-up period were extremely close with the arrest cases registering a survival rate of 40.8, the advise/separate cases a rate of 40.1, and the citation cases a survival rate of 39.1 (see Graph 10-1). It is noteworthy that well over one half of the cases in each treatment category failed within the 180 day follow-up period. With such close survival rates no significant differences were observed in the survival experiences of

offenders assigned any of the three treatment responses (Graph 10-1), between those assigned the arrest treatment and the other two treatments (Graph 10-2), or between those assigned the formal (arrest and citation) and informal (advise/separate) treatments (Graph 10-3). Indeed, the lowest p. value obtained for any of these analyses was .534 for the comparison between arrest and the other two treatments (Graph 10-2).

Outcome Analysis: Summary of Results

In summary, detailed data obtained from victims soon after the presenting incident and six months subsequent to the presenting incident show no differential effect exerted by police response on recidivism. Arresting offenders was no more effective than the other two treatments in deterring subsequent abuse, nor was it any less effective. However, these results must be viewed in light of the large number of cases in which no victim interviews were obtained. There were differences between prevalence as reported in victim interviews and as recorded in official police records. These differences will be addressed in the section that follows.

## SECTION ELEVEN

### OUTCOME ANALYSIS: INTEGRATION OF OFFICIAL RECORDS AND VICTIM INTERVIEWS

The effects of the three treatments employed in this experiment have been examined through the use of two different outcome measures: an official measure of recidivism obtained from police arrest records, and a self-report measure obtained from victim interviews. The two measures each have their respective strengths and weaknesses.

The utilization of an official measure of recidivism, such as subsequent arrest, allows for all subjects in a sample to be tracked with relative ease for a given follow-up period. Thus, there is little case attrition when such official measures are employed. Moreover, the acts of recidivism reported in police arrest records are validated by an independent third party, namely the responding police officers, and have both their occurrence and the time of their occurrence recorded in official reports. On the negative side, however, it must be acknowledged that one should expect only a limited percentage of acts of recidivism to be captured by police arrest records. The police are called in a limited percentage of subsequent incidents of abuse, and only a certain percentage of those incidents are likely to result in the arrest of the offender.

While victim interviews can capture a far wider range of abusive acts committed against victims, this can be achieved only for a certain percentage of the sample since it is unlikely that all of the victims will be interviewed. Moreover, information given by victims is not generally validated by an independent third party, and as a consequence is subject to the inadequacies inherent in any survey research endeavor. These

include dependence upon respondent definition of situations, and problems arising out of inadequate respondent memory, including such factors as both forward and backward telescoping.

Thus far the results of the outcome analyses conducted on official arrest records and victim interviews have been reported separately. The most notable differences between the results obtained through use of the two data sources have been the far higher prevalence and incidence rates of recidivism reported in the victim interviews. These higher rates may be attributed to the broader definition of recidivism employed in the victim interviews and the factors discussed above which limit the amount of recidivism revealed by arrest records.

#### Integration Analysis

The results of the official and victim measures are generally consistent in determining the relative effectiveness of the three treatments tested in this experiment. Neither measure shows arrest to be more effective than the other two treatment responses at deterring subsequent abuse. In general, neither measure shows differences between the treatments that are statistically significant at the .05 level. None of the analyses performed on the victim interview data produced statistically significant results. Of the scores of analyses conducted on the arrest data only two produced significant results. Analyses conducted on the treatments as assigned (the primary mode of analysis employed in this report) showed that the advise/separate treatment was significantly more effective than the citation treatment, and that the informal treatment was significantly more effective than the formal treatments at deterring subsequent abuse (see Tables 9-1 and 9-2).

The results of the separate outcome analyses performed on arrest records and victim interviews are consistent. However, it is important to

examine whether there is a strong overlap between those cases reported as failures in the official records and those reported as failures in the victim interviews. In Table 11-1 the prevalence of of arrest recidivism is cross-tabulated with the prevalence of victim reported recidivism. There is nothing in these data which raises concern about the validity of the findings previously presented. The association between the two prevalence indicators is significant beyond the .001 level. Victims reported recidivism in 60 (92.3%) of the 65 cases in which there was official recidivism. There are only five cases in which there was a report of official recidivism, but no victim reported recidivism. Finally, the total of 141 cases in which there was victim reported recidivism, but no report of official recidivism, is within the range of what might reasonably have been expected given the definitional and reporting issues discussed above.

When this analysis was repeated controlling for treatment as assigned, similar results were obtained. There was considerable consistency among the results obtained for the three treatments individually (see Table 11-2), and these results paralleled those reported in the previous table (Table 11-1).

The absence of treatment effect with the combined arrest and victim reported approach is confirmed by an additional analysis. In order to assess the relationship between treatment assigned and the two measures of recidivism employed in this study (arrest and victim reported recidivism), a technique which is capable of analyzing a multi-dimensional contingency table constitutes the most appropriate approach. The ideal technique for such an analysis, log-linear modeling, allows the researcher to treat multidimensional table cell frequencies as the dependent or response

variable while conceiving of all table factors as independent variables (Knoke and Burke, 1980, pp. 1-5). The typical practice in log-linear modeling is, at the outset, to generate a saturated model of the contingency table which includes all possible main and interaction effects (Knoke and Burke, 1980, p. 12). The saturated model is rarely the most parsimonious explanation of the data, but is useful for identifying important factors for reduced model analysis (Knoke and Burke, 1980, p. 17).

An examination of Table 11-3 reveals that the saturated model includes three parameter estimates which are large enough relative to their standard errors to reject the hypothesis that they are not different from zero.<sup>1</sup> The primary inference emerging from the saturated model is that the cell frequencies in Table 11-2 cannot accurately be expressed as a linear function of a model that includes parameter estimates of treatment assigned (TA).

A reduced model restricted to the three statistically significant effects was analyzed next. The results of the reduced model analysis are consistent with the saturated model conclusions. All three effects (arrest recidivism, victim reported recidivism, and the product of the two) retain their statistical significance. With the estimation of a more parsimonious model, excluding treatment assigned as either a main or nested effect, comes a more accurate prediction of cell frequencies in Table 11-2.

The log-likelihood chi square indicates that the observed and expected frequencies in Table 11-2 are not significantly different. Treatment

<sup>1</sup>Significant parameters included those which were estimated for arrest recidivism (AR), victim reported recidivism (VR), and the product of the two (AR x VR). The parameter estimate for treatment assigned (TA) is not large enough relative to its standard error to sustain a conclusion that it is different from zero. In fact, none of the parameters, of which treatment assigned (TA) is a component part, achieves statistical significance. The saturated model is, consequently, not a satisfactory explanatory tool in estimating cell frequencies in Table 11-2.

assigned (TA), as either a nested or main effect, is, therefore, not helpful in arriving at an understanding of frequency distributions within the cells of the three dimensional table (Knoke and Burke, 1980, pp. 30-31).

Since there is no evidence that the parameter value for treatment assigned is significantly different from zero, it is reasonable to conclude that cell frequencies are not a linear function of treatment assignment values. As treatment assigned did not appear to affect the prevalence or frequency of recidivism, and as it did not affect the quantity of time to failure, it does not appear to affect the distribution of cases in Table 11-2. From this, it follows that cell frequency distributions are consistent across values of treatment assigned or, essentially, the distributions of cases within each of the three sub-tables (one for each treatment) do not appear to differ from each other.

## SECTION TWELVE

### CRIMINAL JUSTICE SYSTEM PROCESSING OF CITATION & ARREST CASES

This study focuses on the law enforcement response to spouse abuse and is primarily concerned only with action taken by the police. However, the police are affected by what other segments of the criminal justice system do. Police officers often complain that it is a waste of time arresting spouse abusers because nothing else happens after they are arrested. Because of the negative effect such an attitude may have on police support for pro-arrest policies, and to understand more fully the impact of the treatments being examined, it was considered worthwhile to investigate the extent to which eligible cases in which the police had taken formal action (i.e. arrested the suspect or issued him a citation) were further processed through the criminal justice system.

Of the 686 eligible cases processed by the Charlotte police department, 271 involved the arrest of the offender, and 181<sup>1</sup> the issuance of a citation to the offender. These offenders were tracked through the local criminal justice system by a court official utilizing the computerized county criminal justice records information system.

Records were obtained for 443 cases (259 arrest and 184 citation cases). Records were missing for nine cases either because the court official was unable to locate the case (N = 5) or because the case involved an unserved warrant (N = 4). The remaining discrepancies between the numbers of arrest and citation treatments delivered by officers

<sup>1</sup> Included in this number are the two cases in which the offender was issued a criminal summons.

at the scene and the numbers of these cases processed through the criminal justice system result from the actions of the magistrates. Thus, an order for arrest may have been made in what was initially a citation case and a citation or summons may have been issued in what originally was an arrest case.

As indicated in Chart 12-A, a majority of the cases (284, or 69.5%), did not result in prosecution of the offender. All but seven of these cases were voluntarily dismissed by the prosecuting attorney. These seven cases were administratively dismissed by the chief judge because they had been left pending too long. The likelihood of dismissal was minimally affected by whether the offender had been arrested or issued a citation, with 63.0% of the citation and 65.6% of the arrest cases resulting in dismissal (see Charts 12-B and 12-C).

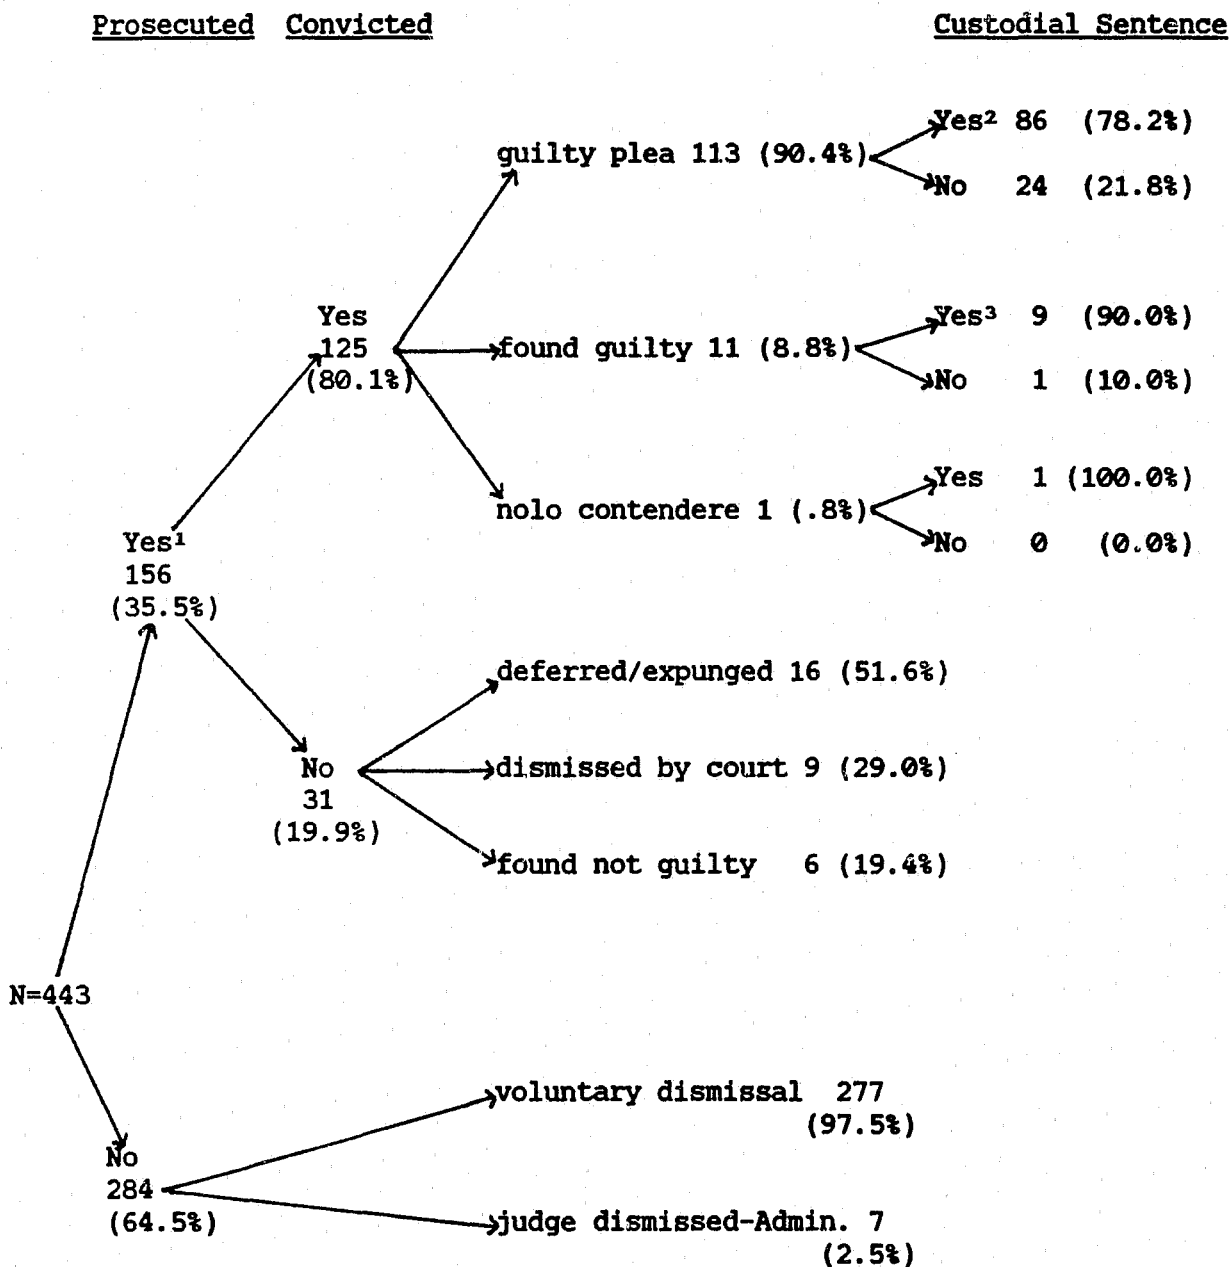

The vast majority, 125 (80.1%), of the 156 cases that were prosecuted resulted in conviction (see Chart 12-A). In nearly all (113) of these cases the defendant pleaded guilty. In 95 (78.5%) of the 121 cases in which the disposition was known the defendant received a custodial sentence. Defendants who were found guilty at trial (N = 9) were more likely than those who pled guilty (N = 86) to receive an active jail sentence (90.0% v. 78.2%).

Conviction with a custodial sentence did not mean, however, that most offenders actually served any jail time subsequent to their convictions. Of the 95 who received custodial sentences, 91 had those sentences suspended. In sum, only four offenders, 4.2% of those convicted who received a custodial sentence, or 0.9% of all the men who had been issued a citation or arrested, spent time in jail beyond the initial arrest. A total of eight offenders were given credit for time served prior to going

to trial. The median amount of time between the presenting incident and release from jail for arrested offenders was 9.4 hours with 70 (27.5%) spending four or less hours, 81 (31.8%) between four and twelve hours, 61 (23.9%) more than 12 but less than 48 hours, and 43 (16.9%), including both those given active time and those given credit for time served, 48 hours or more.<sup>2</sup>

When the prosecution failed to result in conviction this was generally (56.5% of the cases) the result of the defendant being given deferred prosecution. In this type of case disposition the defendant, who typically must be a first time offender, admits the factual allegations against him, but is not processed further through the court system provided he remains on good behavior for a specified period of time. If he does so, then the case against him is dropped and the records may be expunged. Defendants who had been issued citations were more likely to be placed on deferred prosecution than were those who had been arrested. This accounted for the higher percentage of citation cases in which the District Attorney's Office took action failing to result in an official conviction (34.3% v 9.0% for arrest cases). A possible explanation for this could be that prosecutors were viewing cases in which police officers had issued citations as less serious than those in which arrests had been made without realizing these police actions had been randomly assigned.

An examination of various independent variables that might explain the decision to prosecute revealed that demographic characteristics such as race, age, and marital status were not factors. The presence of others (especially non-family members) at the scene of the incident was

<sup>2</sup>Source: Court Records; Jobfile - CJpen; Datafile - Suspect; Variables - Ptype and Hour.

moderately associated with the decision to prosecute.<sup>3</sup> In arrest cases if the victim had argued against the arrest at the scene, then the case was less likely to result in prosecution.<sup>4</sup>

The major finding in this substudy is that a minority of those cases in which the police took formal action against the offender were prosecuted by the District Attorney's Office. It may be suggested that the figure of 35.5% is inflated since it counts cases of deferred prosecution as prosecuted cases. However, despite the fact that this disposition technically constitutes a waiver of prosecution, it involves cases in which the District Attorney has taken action against the offender and obtained an admission of the factual allegations. Prosecution is waived only as long as the defendant remains on good behavior. If he does not do so he may be convicted and sentenced accordingly.

## SECTION THIRTEEN

### DISCUSSION

The Charlotte Spouse Assault Replication Project was initiated in 1986 through a grant from the National Institute of Justice, and was operated in coordination with five other NIJ funded projects of similar purpose: to replicate and extend the Minneapolis experiment which led to the conclusion that arrest was a more effective deterrent to subsequent abuse than were other police responses.

The Charlotte study, as was true in the other project sites, was conducted as an experiment with as much rigor as is possible in performing experimental field research. All cases entered the experiment after a call to the police for response to an abusive incident. All cases had to satisfy certain eligibility criteria imposed for legal, policy, or research considerations. The cases entering the Charlotte project all involved abusive incidents which were legally classified as misdemeanors; felony cases and those which did not meet the legal criteria for a misdemeanor were excluded. These parameters were common to the other spouse assault projects as well.

The Charlotte project differed from the other projects in two significant ways. First, this project was the only one to utilize a police-issued citation as one of the treatment options (in addition to arrest and advise/separate). Second, the project in Charlotte was the only one to employ the entire patrol division in round-the-clock and citywide sampling for the full duration of the project. Thus, although

there was significant experimental commonality across the different project sites, this project was not a duplicate of any of the others.

The most important commonality among the projects is that they all were charged with addressing the core question of whether arrest is the most effective law enforcement response for deterring spouse abusers from committing subsequent acts of abuse. It is on this question that the experimental research was focused and the majority of the effort and resources expended. The Charlotte project defined spouse abuse cases as cases involving now or ever-married and now or ever-cohabiting different-sex couples. Following a controlled experimental design with carefully prescribed and monitored eligibility criteria, these cases were randomly assigned to one of the three police treatment options. Extensive data were collected from official police records and from interviews with female victims. This enabled careful tracking of abusive incidents subsequent to the presenting incident.

The results of the Charlotte experiment are decisive and unambiguous, and indicate that arrest of misdemeanor spouse abusers is neither substantively nor statistically a more effective deterrent to repeat abuse than either of the other two police responses examined in this location. Based on thorough analysis of data from official police records of rearrest, as well as from intensive interviews with victims of abuse, there is no evidence that arrest is a more effective deterrent to subsequent assault. This conclusion remains regardless of the measure of recidivism utilized -- prevalence, incidence, or time to failure. If either victim interview or official police data showed arrest to be significantly better at deterring assault, then a case could be made on that basis; but neither data set supports this conclusion. Were

there a pattern discerned in the data which showed arrest to be generally more effective, even if not at statistically significant levels, it would be tempting to come to a positive conclusion about the deterrent benefits of arrest. However, there is no pattern in that direction. We thus have no choice but to conclude, based on the Charlotte data, that arrest had no more of a significant deterrent value than did the other two police responses.

Beyond the core question of the deterrent effects of arrest, careful examination of the victim interview data in this report reveals alarmingly high levels of repeat incidents of spouse abuse, suggesting that the scope of the problem is far greater than police data indicate. As presented in Section 10, 61.5% of women have experienced another abusive incident within six months. Official records, those based on rearrest by police, show predictably lower prevalence and incidence rates of recidivism than do interview data. Rearrest rates are an extremely conservative measure of recidivism, as they are a conservative measure of spouse abuse in general. Based on police data (see Section Nine), repeat incidents are the exception rather than the rule. Based on interviews, however, repeat incidents are the rule rather than the exception, with the majority of women who were interviewed having experienced at least one more abusive incident since the original presenting incident six months earlier.

The apparent discrepancy between police data and interview data, as discussed in Section Eleven, is easy to explain. First, a significant percentage of abusive incidents that occur are not reported to the police. Second, some of the abusive incidents reported in the initial or six-month interview are relatively minor and do not legally qualify as crimes, i.e., there is an absence of probable cause or the act committed does not constitute a criminal offense. In some cases this may explain

why the police were not called. A large percentage of the spouse abuse calls the police did receive during the period the experiment was being conducted were determined by the responding officers to be situations in which there was not sufficient probable cause to believe that a crime had been committed (see Section Four).

Since there was reason to believe arrest to be a successful deterrent (based, for example, on the results of the Minneapolis experiment or the theory of "empowerment" of the victim) we can only speculate on why it was not so in the Charlotte experiment. First, the majority of male offenders in our sample have previous criminal histories. Thus, in many cases arrest is neither a new nor an unusual experience, since many of them have already spent significant time in jail. Second, for many of the couples in this research, abuse is a common rather than an occasional occurrence. Indeed, for some, abuse is chronic. For offenders who have criminal histories, or for those who have been victims in chronically abusive relationships, it is unrealistic to think that arrest will have much impact. Third, arrest alone, which was a focal point of the research projects, may not constitute as strong a societal response as commonly perceived. The popular conception is that the arrested person is put in jail and that that constitutes a punitive action sufficient to change behavior. The fact is that "time in jail" is often non-existent or minimal beyond the booking time required, so that arrest with immediate release may simply not mean very much, particularly when the offenders have been arrested before. Fourth, while not technically part of the scope of this project, some information was gathered on the processing of offenders through the criminal justice system. The data support the conclusion that it is very rare for a spouse abuser to be found guilty

and to be ordered to spend any significant time in jail. Fifth, as jails become more crowded, and as the public learns that even felons are receiving community based punishments and early releases from correctional institutions, it does not take much imagination to conclude that premium jail space will not be used on spouse abusers. Sixth, we can conclude that arrest is not a significant deterrent for misdemeanor spouse assault. We have no way of knowing if arrest would be more of a deterrent for felony spouse assault, or for lower levels of abuse which do not now satisfy the criteria for misdemeanor arrest.

## SECTION FOURTEEN

### EPILOGUE

The official results of the Charlotte Spouse Assault Replication Project are detailed in the preceding 13 sections. After spending four years immersed in this investigation, the project staff prefers to conclude this report with what might be labeled "informal reflections."

The prevalence of numerous extraneous variables forces social and behavioral science researchers to define study variables precisely, and narrowly specify hypotheses of relationships among variables. This research focused upon the relationship between three specific police responses to misdemeanor spouse assault and repeat violence within the dyad over a six-month period. In theoretical terms, it addressed only specific deterrence - the effect of punishment on the likelihood of the accused repeating the same behavior against the same victim. It did not include general deterrence (the effect punishing one person may have on the behavior of others), nor did it address other aspects of deterrence theories such as the effects of certainty, celerity or severity of punishment on subsequent spouse assault.

The data do not support the hypothesis that the treatments differ in deterring abuse. This is significant in that while complementing the results of a similar study conducted in Omaha (Dunford et al, 1989), the results do not appear to be in agreement with the earlier Minneapolis study that found arrest to be a more effective deterrent than the other treatments (Sherman & Berk, 1984). The results of the Charlotte and Omaha

studies suggest that there is not adequate support for a mandatory or presumptive arrest policy based on specific deterrence. The hope that arrest alone could contribute to the solution of this serious problem is unfulfilled.

Questions concerning the appropriate societal response to spouse assault and the role of the police in this response are not answered by this research. There is little doubt that misdemeanor spouse assault has been added to the list of actions that subordinate family privacy considerations to the greater public interest in reducing this kind of behavior. Further, there is no doubt that the police will continue to be involved in spouse abuse situations since they are the only agency available in all areas at all hours of the day and night. Defining spouse assault as criminal is a requisite step in strengthening the social norms. It places the police in a lynch pin role, connecting the offender and victim with other social, community and criminal justice resources through arrest or referral.

The results of this study are likely to disappoint those who strongly support pro-arrest policies for spouse abusers. Despite the failure of arrest to have a particular deterrent effect, and despite the inadequacies of the present criminal justice system, arrest may still constitute a viable and appropriate response for the police to pursue in many spouse abuse situations.

Even though arrest has not been shown to have a particular deterrent value, and even if arrest may not have much of a punitive value, it may still constitute a more conscionable choice than non-arrest. Not to arrest may communicate to men that abuse is not serious and to women the message that they are on their own. It may communicate to children, who

very often witness abuse of their mothers, that the abuse of women is tolerated, if not legitimated. It may communicate to the public at large that a level of violence which is unacceptable when inflicted by a stranger is acceptable when inflicted by an intimate. It is imperative that we recognize the seriousness of spouse abuse and employ measures, however imperfect, to reduce it, even if we do not yet know how to achieve a dramatic reduction in its occurrence.

APPENDIX A - ITEM # 3

M E M O R A N D U M

DATE:

TO:

FROM:

  
J. J. Kelley, Major

Project Director - Spouse Assault Program

SUBJECT: Ref: Eligible Cases

On \_\_\_\_\_, you completed case # \_\_\_\_\_  
which involved a Domestic Assault reported to you. You carried out  
treatment # \_\_\_\_\_ which is \_\_\_\_\_.  
According to the Police computer print out, which has been reviewed, the  
treatment should have been # \_\_\_\_\_ which is \_\_\_\_\_.

Please respond on this memorandum the reason(s) you failed to carry out the  
designated response treatment by \_\_\_\_\_ (date). If you did not  
request a treatment code from the dispatcher, please explain the circumstances  
of the code you used.

If you have any questions, I will be glad to explain the procedure to you.

RESPONSE:

APPENDIX A - ITEM # 4

APPENDIX A - ITEM # 5

INITIAL INTERVIEW

INFORMED CONSENT STATEMENT

My name is \_\_\_\_\_, and I am one of the interviewers with the Charlotte Spouse Assault Study. I'd be glad to provide identification if you'd like.

This study is being conducted by researchers at the University of North Carolina at Charlotte, along with the Charlotte Police Department. If you have any questions about the study, you may call Dr. Ira Hutchison at UNCC. His number is 547-2535.

The purpose of this research is to talk to women who have been involved in domestic disputes where the police have gotten involved. We are trying to find out if what the police do helps reduce further disputes or assaults. This research may not be of help to you, but hopefully it will help us find ways to cut down on the problem of domestic violence.

This interview will last about an hour, and you will be paid for your time (\$35 if interviewed at home; \$45 if at office). Your participation in the interview is completely voluntary. If any of the questions or the interview itself make you uncomfortable, please tell me; you are free to skip any questions you don't like or even to cancel the interview after we have started.

The interview includes questions about the time the police were here, about other experiences you may have had, and about some of your growing up experiences with abuse or violence. If you'd like to look at the questions before we start I'd be happy to show them to you. Would you like to see them? (PAUSE).

Whatever you tell me will be held in total confidence. After I turn in this interview to the researchers, the cover sheet with your name is torn off and kept in a locked file. Your answers are then assigned an ID number. No one in the Charlotte Police Department will have any access to your answers. When reports are written, answers will be combined from lots of people so it is not possible to identify any individual. We are sure that we can guarantee the confidentiality of your answers.

If you would like to go ahead with the interview, I'd like to get your signature on this page to show that I have read this page to you and that you understand what we are doing. This page will be kept separate from any of your answers. Do you have any questions I might answer before we start?

QUESTIONS ONLY FOR PRESENT COHABITANTS AT TIME OF PRESENTING INCIDENT

12. About how long have you and \_\_\_\_\_ been living together?

- 01 less than 2 weeks
- 02 2 weeks-less than 4 weeks
- 03 4 weeks-less than 4 months
- 04 4 months-less than 6 months
- 05 6 months-less than 9 months
- 06 9 months-less than 1 yr.
- 07 1 yr.-less than 1 1/2 yrs.
- 08 1 1/2 yrs.-less than 2 yrs.
- 09 2 yrs.-less than 3 yrs.
- 10 3 yrs.-less than 4 yrs.
- 11 4 yrs.-less than 7 yrs.
- 12 7 yrs. or more

13. On an average, do you live together "full-time," like every night or is it less than that?

Full time (7)      Less

If less: About how many nights a week do you usually spend together?

\_\_\_\_(enter number here). (1-6)

14. When you decided to live together, did he move here with you, or is this more his place, or did you pick out this (apt./house) together...or is it maybe somebody else's place?

1. Female's    2. More male's    3. Joint    4. Other

15. Do you have another place where you could easily live for a few days if you wanted to?

1. Yes      2. No

IF YES, WHERE? \_\_\_\_\_

16. Does he \_\_\_\_\_ have another place where he could easily live for a few days if he wanted to?

1. Yes      2. No

IF YES, WHERE? \_\_\_\_\_

17. How long had you known \_\_\_\_\_ before you started living together? \_\_\_\_\_ months (01-99)

18. How long had you been dating or seeing each other before you started living together? \_\_\_\_\_ months (01-99)

19. Who was most interested in starting to live together...was it mainly you, or him, or was it pretty much joint?

1. Female    2. Male    3. Joint

20. Have you had other living-together relationships similar to this one?

\_\_\_ Yes      0 No

If yes, about how many? \_\_\_\_\_

QUESTIONS ONLY FOR EX-COHABITANTS

21. About how long had you and \_\_\_\_\_ been living together?
- 01 less than 2 weeks  
 02 2 weeks-less than 4 weeks  
 03 4 weeks-less than 4 months  
 04 4 months-less than 6 months  
 05 6 months-less than 9 months  
 06 9 months-less than 1 yr.  
 07 1 yr.-less than 1 1/2 yrs.  
 08 1 1/2 yrs.-less than 2 yrs.  
 09 2 yrs.-less than 3 yrs.  
 10 3 yrs.-less than 4 yrs.  
 11 4 yrs.-less than 7 yrs.  
 12 7 yrs. or more
22. On an average, did you live together "full-time," like every night or was it less than that?
7. Full time \_\_\_\_\_ Less
- If less: About how many nights a week did you usually spend together?  
 \_\_\_(enter number here). (1-6)
23. When you lived together, did he move here with you, or was this more his place, or did you pick out this (apt./house) together...or was it maybe somebody else's place?  
 1. Females 2. More males 3. Joint 4. Other
24. Did you have another place where you could easily have lived for a few days if you wanted to?  
 1. Yes 2. No  
 IF YES, WHERE? \_\_\_\_\_
25. Did he (partner) have another place where he could easily live for a few days if he wanted to?  
 1. Yes 2. No  
 IF YES, WHERE? \_\_\_\_\_
26. How long had you known \_\_\_\_\_, before you started living together? \_\_\_\_\_ months (01-99)
27. How long had you been dating or seeing each other before you started living together? \_\_\_\_\_ months (01-99)
28. Who was most interested in starting to live together...was it mainly you, or him, or was it pretty much joint?  
 1. Female 2. Male 3. Joint
29. Have you had other living-together relationships similar to at one?  
 \_\_\_Yes (0)No
- If yes, about how many? 1, 2, 3, 4, 5, 6, 7, 8, 9
30. What were the main reasons you stopped living together? \_\_\_\_\_

44. Have you had any kind of contact with him since you last lived together?  
1. Yes 2. No

45. IF YES, ASK: What kind of contact? \_\_\_\_\_

46. FOR DIVORCED/SEPARATED/EX-COHABITANTS NOT LIVING TOGETHER AT TIME OF INCIDENT:

Have you had any kind of contact with him since the incident the other day/night?  
1. Yes 2. NO

47. IF YES, ASK: What kind of contact have you had with him?

\_\_\_\_\_  
\_\_\_\_\_

SECTION C: PRESENTING INCIDENT  
PRIOR TO POLICE ARRIVAL

I'd like to find out something about what was going on the day/night the police were here, but before they came.

Were you and \_\_\_\_\_ having an argument, or fight, or just what was it all about? Just tell me in your own words what was going on. INTERVIEWER: THE POINT HERE IS THE APPARENT CAUSE OF THE ARGUMENT/FIGHT.

62. So, would you say that the main cause was \_\_\_\_\_ (INTERVIEWER: TRY TO DETERMINE MAIN CAUSE) or something else?

- |                                    |                                   |
|------------------------------------|-----------------------------------|
| 1. His use of money                | 13. Her use of money              |
| 2. His employ/unemployment         | 14. Her employ/unemployment       |
| 3. His drinking/drugs              | 15. Her drinking/drugs            |
| 4. His treatment of kids           | 16. Her treatment of kids         |
| 5. His extramarital or other women | 17. Her extramarital or other men |
| 6. His treatment of kin            | 18. Her treatment of kin          |
| 7. His friends                     | 19. Her friends                   |
| 8. His household tasks             | 20. Her household tasks           |
| 9. His nagging                     | 21. Her nagging                   |
| 10. His work around house          | 22. Her work around house         |
| 11. His alimony/support payments   | 23. Her alimony/support payments  |
| 12. His other: (specify)           | 24. Her other: (specify)          |

63. If that was the main argument, was \_\_\_\_\_ also a big part of it (INTERVIEWER: TRY TO DETERMINE SECOND PLACE) or what was the other main thing would you say?

\_\_\_\_\_ ENTER CODE FROM ABOVE, HERE (1-24)

64. Relative to other fights you've had with him was this one.....
1. More serious than most
  2. Less serious than most
  3. About the same as most
65. Was this particular fight/argument/problem something you've had other fights/arguments about?
1. Yes
  2. No (Go to 68)
66. IF YES, ASK: About how many times in the last six months have you fought over this?
- |                   |                      |
|-------------------|----------------------|
| 1...None          | 4...6-9 times        |
| 2...Once or twice | 5...10-15 times      |
| 3...3-5 times     | 6...16 or more times |

67. IF ONCE OR MORE, ASK: About how many of these fights over \_\_\_\_\_ happened in the week right before the incident on \_\_\_\_\_
- 1...None                      4...6-9 times  
 2...Once or twice          5...10-15 times  
 3...3-5 times                6...16 or more times

(SKIP FOR EX'S)

68. Before this particular fight/argument, would you say that your relationship was under a lot of stress, moderate stress, or relatively little or no stress?
- 1...Lot      2...Moderate      3...Little      4...None

(SKIP FOR EX'S)

69. Before this particular fight/argument, how would you have described your relationship with him? Would you say it was:
- 1...Very satisfying                      3...Some what dissatisfying  
 2...Somewhat satisfying                4...Very dissatisfying

Could you please tell me, just yes or no, if any of the following had happened, during that incident/fight, but before the police arrived?

130. \_\_\_\_\_  
 \_\_\_\_\_

131. Would you say you called the police (or asked someone to call) mainly because of what he had already done OR you were afraid of what he might do if the police were not called...or a mixture of both?

1. Already done      2. Fear      3. Both

132. Did you call the police right away during the incident, or did you wait a while before calling?

1. Immediately      2. Waited

IF WAITED, ASK: About how long after the incident was over did you call the police?

133. Was it...

1. less than 10 minutes  
2. 10 minutes to half an hour  
3. half an hour to an hour  
4. over an hour

IF WAITED, ASK: Why did you wait?

134. \_\_\_\_\_  
\_\_\_\_\_

135. About how long did it take for the police to get here after they were called?

\_\_\_\_\_ minutes (01-99)

136. Was \_\_\_\_\_ drinking right before or during this particular incident?

1. Yes      2. No (go to 141)      9 = Don't know

IF YES, ASK:

137. About how many drinks (by a "drink" we mean 12 oz. of beer, or 1 - 1/2 ozs. of hard liquor or 5 oz. of wine) did he have before the police came?

- 1, 2, 3, 4, 5, 6, 7, 8, 9

138. Was his drinking that night/day about usual for him, or was it a lot more or a lot less?

1. More      2. Usual      3. Less

139. In your opinion, was he drunk?

1. Yes      2. No

140. IF NO: Do you think he was under the influence of alcohol?

1. Yes      2. No      9 = Don't know

141. How about you...were you doing any drinking right before or during the incident?

1. Yes      2. No

IF YES, ASK:

142. About how many drinks (by a "drink" we mean 12 oz. of beer, or 1 - 1/2 ozs. of hard liquor or 5 oz. of wine) did you have before the police came?

- 1, 2, 3, 4, 5, 6, 7, 8, 9

143. Was your drinking that night/day about usual for you, or was it a lot more or a lot less?

1. More      2. Usual      3. Less

144. In your opinion, were you drunk?

1. Yes      2. No

144a. IF NO: Do you think you were under the influence of alcohol?

1. Yes      2. No

145. Was \_\_\_\_\_ using any drugs right before or during the incident?

1. Yes      2. No      9. Not sure/don't know

IF YES, ASK:

146. What kind of drugs was he taking that day/night?

---

147. Were you using any drugs right before or during the incident?

1. Yes      2. No

IF YES, ASK:

148. What kind of drugs were you taking that day/night?

---

SECTION D: PRESENTING INCIDENT  
POLICE TREATMENT

Now I would like to talk to you about a number of things that the police sometimes do.

Which of the following things did the police do when they arrived on (date of research incident)?

Did they (ask each one)...

GENERAL

	YES	NO	Not App.	Don't Know
149. Calm things down?	1	2	8	9
150. Give you an information card?	1	2	8	9
151. Provide advice on how to get along with one another?	1	2	8	9
152. Provide information on legal rights or assistance?	1	2	8	9
153. Recommend going to someone for legal assistance?	1	2	8	9
154. Provide information on women's shelters or support groups?	1	2	8	9
155. Recommend or help you contact any women's shelter or support group?	1	2	8	9
156. Recommend, refer you to family counseling?	1	2	8	9
157. Transport you to a hospital or a shelter?	1	2	8	9
158. Refer you to a victim advocacy program?	1	2	8	9
159. Order your _____ to leave the house?	1	2	8	9
160. Order you to leave?	1	2	8	9
161. Arrest your _____?	1	2	8	9
162. Arrest you?	1	2	8	9
163. Talk to you by yourself?	1	2	8	9
164. Talk to your _____ alone without you?	1	2	8	9
165. Talk with both of you together?	1	2	8	9
166. Did the police try to get you to work out a solution to your difficulties?	1	2	8	9
167. Did you reach a solution to your immediate problem?	1	2	8	9

ARREST CASES ONLY

184. Did the police put handcuffs on your \_\_\_\_\_  
1. Yes 2. No 3. Don't know
185. To your knowledge, has he ever been arrested before?  
1. Yes 2. No 3. Don't know  
IF YES:
186. About how many other times has he been arrested? \_\_\_\_\_ (1-9)
187. How many of these times were for abuse/assault? \_\_\_\_\_ (1-9)
188. Were you glad the police arrested him?  
1. Yes 2. No  
IF NO:
189. Why didn't you want him arrested?  
1. Lost income 3. Cause I love him  
2. Make matters worse 4. Other: specify \_\_\_\_\_
190. What did you want them to do? \_\_\_\_\_  
1. Warn him  
2. Scare him  
3. Other: specify \_\_\_\_\_
191. Did you try to talk the police out of arresting him?  
1. Yes 2. No
192. Did he try to talk the police out of arresting him?  
1. Yes 2. No

When the police started to arrest him, do you remember what he said or did? For example, was he:

(CHECK ALL THAT APPLY)	YES	NO
193. Calm and quiet	1	2
194. Apologetic and making promises	1	2
195. Fearful or afraid of being arrested	1	2
196. Embarrassed or ashamed	1	2
197. Angry or hostile	1	2
198. Other SPECIFY: _____		

199. In your opinion, will the arrest help discourage him from abusive incidents like the other day/night?

Would you say:

1. Definitely yes 3. Probably no  
2. Probably yes 4. Definitely no

After the police arrested him, do you remember what you expected him to be like when you got together again? For example, did you expect him to be:

(CHECK ALL THAT APPLY)	YES	NO
200. Calm and quiet	1	2
201. Apologetic and making promises	1	2
202. Fearful or afraid of being arrested	1	2
203. Embarrassed or ashamed	1	2
204. Angry or hostile	1	2
205. Other SPECIFY: _____		

SECTION E: POST INCIDENT  
SEPARATIONS AND REUNIONSINTERVIEWER

Questions 206-236 Advise/separate cases OR Citation cases only

Questions 237-254 arrested Cases ONLY

206. While the police were still here, did they ask/recommend that \_\_\_\_\_ (partner) leave for awhile?

1. Yes (GO TO 207)      2. No (GO TO 208)

207. IF YES, ASK: DID HE ACTUALLY LEAVE?

1. Yes    2. No (GO TO 209)

208. IF NO, ASK: After the police left did he leave for awhile?

1. Yes    2. No

209. While the police were still here, did they ask/recommend that you leave for awhile?

1. YES (GO TO 210)    2. NO (GO TO 212)

210. IF YES, ASK: Did you actually leave?

1. Yes    2. No

211. IF YES, ASK: Did you leave to get medical attention or for another reason?

1. Medical    2. Other

212. IF NO, ASK: After the police left did you leave for awhile?

1. Yes    2. No

INTERVIEWER: IF NEITHER VICTIM NOR PARTNER LEFT ASK:

What happened after the police left? Please just tell me yes or no for each of the following?

	YES	NO
213. Was he apologetic or sorry for what had happened?	1	2
214. Did he make any promises about it not happening again?	1	2
215. Was he embarrassed that the police came?	1	2
216. Was he angry that the police came?	1	2
217. Did you make up?	1	2
218. Did the argument resume?	1	2

Initial

17

	YES	NO
219. Did he hit, slap, hurt or try to hurt you in any way?	1	2
220. Did he hit, slap or try to hurt any other family member?	1	2
221. Did he damage any property?	1	2
222. Did he threaten to hurt you or any family member or threaten to damage any property?	1	2
223. INTERVIEWER, ASK IF <u>PARTNER ONLY LEFT</u> ? About how long was it before he returned home? _____hours (01-99)		
224. ASK IF VICTIM ONLY LEFT: About how long was it before you returned home?		
225. _____hours (01-99)		
226. ASK IF BOTH VICTIM AND PARTNER LEFT FOR A WHILE: About how long was it before you were both back together at home? _____hours (01-99)		

ASK IF EITHER VICTIM OR PARTNER OR BOTH LEFT FOR AWHILE?  
What happened when the two of you got back together?

	YES	NO
227. Was he apologetic or sorry for what had happened?	1	2
228. Did he make any promises about it not happening again?	1	2
229. Was he embarrassed that the police came?	1	2
230. Was he angry that the police came?	1	2
231. Did you make up?	1	2
232. Did the argument resume?	1	2
233. Did he hit, slap, hurt or try to hurt you in any way?	1	2
234. Did he hit, slap, hurt or try to hurt any other family member?	1	2
235. Did he damage any property?	1	2
236. Did he threaten to hurt you or any family member or threaten to damage any property?	1	2

Initial  
SECTION F

19

Now I'd like to ask you about what's been happening since the time we've been talking about. So these questions are all about what's happened in the last days/weeks.

255. Since that incident, has he THREATENED to hurt you in any way?

1. Yes 2. No 9. DK

IF NO, GO TO Q. 259.

IF YES, ASK 256-258

256. How many separate times has this happened?

1 2 3 4 5 or more 8 NA 9 DK

257. How soon was it after the incident we've been talking about was it that he first threatened you?

I: ENTER EXACT NUMBER OF DAYS AFTER P.I. THAT  
FIRST THREAT OCCURRED \_\_\_\_ DAYS (1-999)

258. IF MORE THAN ONE THREAT, ASK: When was it that he most recently threatened you?

I: SAME INSTRUCTIONS AS ABOVE \_\_\_\_ DAYS (1-999)

259. Since the (presenting) incident, has he ACTUALLY hit you, slapped you or tried to hurt you in any way?

1 Yes 2 No 9 DK

IF NO, GO TO Q. 263

IF YES, ASK 260-262

260. How many separate times has he done this?

1 2 3 4 5 or more 9 DK

261. How soon (after the presenting incident) was it that he did this the FIRST time?

I: ENTER EXACT NUMBER OF DAYS AFTER P.I. THAT V  
WAS HIT, SLAPPED, HURT OR TRIED TO HURT  
\_\_\_\_ DAYS (1-999)

262. IF MORE THAN ONE HIT, ETC., ASK: When was the most recent time that he did this?

I: SAME INSTRUCTIONS AS ABOVE \_\_\_\_ DAYS (1-999)

263. Since the (presenting) incident, has he THREATENED to hurt any member of the family?

1 Yes 2 No 9 DK

IF NO, GO TO Q. 267

IF YES, ASK 264-266

264. How many separate times has he done this (since PI)?

1 2 3 4 5 or more 8 NA 9 DK

265. How soon (after PI) was it that he FIRST threatened someone?

I: ENTER EXACT NUMBER OF DAYS HERE \_\_\_\_ DAYS (1-999)

266. IF MORE THAN ONE THREAT, ASK: When was the most recent time that he's threatened someone?

I: SAME INSTRUCTIONS AS ABOVE \_\_\_\_ DAYS (1-999)

267. Since the incident we've been talking about, has he ACTUALLY hit, slapped, hurt or tried to hurt any member of the family?  
1 Yes 2 No 9 DK

IF NO, GO TO 271

IF YES, ASK 268-270

268. How many separate times has he done this to a family member?

1 2 3 4 5 or more 8 NA 9 DK

269. How soon was it (after PI) that he FIRST did this?

I: ENTER EXACT NUMBER OF DAYS HERE \_\_\_\_ DAYS (1-999)

270. IF MORE THAN ONE EPISODE, ASK: When was the most recent time that he's done this?

I: SAME INSTRUCTIONS AS ABOVE \_\_\_\_ DAYS (1-999)

271. Has he THREATENED to damage any property (since the PI)?

1 Yes 2 No 9 DK

IF NO, GO TO Q. 275

IF YES, ASK 272-274

272. How many separate times has he made this kind of a threat (since the PI)?

1 2 3 4 5 or more 8 NA 9 DK

273. How soon was it (after the PI) that he FIRST threatened to damage property?

I: ENTER EXACT NUMBER OF DAYS HERE \_\_\_\_ DAYS (1-999)

274. IF MORE THAN ONE EPISODE OF THREATENED DAMAGE, ASK: When was the most recent time that he's made such a threat?

I: ENTER EXACT NUMBER OF DAYS HERE \_\_\_\_ DAYS (1-999)

275. Since the (presenting) incident, has he ACTUALLY damaged any property?

1 Yes 2 No 9 DK

IF NO, GO TO NEXT PAGE

IF YES, ASK 276 - 278

276. How many separate times has he actually done some damage to property (since the PI)?

1 2 3 4 5 or more 8 NA 9 DK

277. How soon was it (after PI) that he first did some property damage?

I: ENTER EXACT NUMBER OF DAYS AFTER PI  
 \_\_\_\_\_ DAYS (1-999)

278. IF MORE THAN ONE EPISODE OF PROPERTY DAMAGE, ASK:  
 When was the most recent time that he's damaged some property?

I: ENTER EXACT NUMBER OF DAYS AFTER PI\_\_\_\_\_(1-999)

#### INTERVIEWER

The goal of this section is to get more detailed information on the FIRST OCCURRENCE of anything after the presenting incident, and - if there has been more than one repeat - detailed information on the MOST RECENT OCCURRENCE of anything.

IF THERE HAVE BEEN NO REPEAT INCIDENTS...GO TO PAGE 32

IF THERE HAS BEEN ANY REPEAT INCIDENT, READ BELOW:

The possibilities are:

- |  |   |
|--|---|
| A. Single behavior only<br>Single day only | e.g. only one <u>type</u> of behavior<br>on only one day.   |
| B. Multiple behaviors<br>Single day only   | e.g. victim is threatened AND he<br>also threatens one of the kids,<br>but both happen on the same day.   |
| C. Single behavior only<br>Multiple days   | e.g. victim is hurt on two different<br>days.   |
| D. Multiple behaviors<br>Multiple days     | e.g. Case 1: victim is threatened and<br>hurt on the same day; three days<br>later he threatens one of the kids<br><br>Case 2: on one day, the victim is<br>actually hurt, on another day he<br>threatens property damage, on<br>another day he threatens victim. |

#### A. SINGLE BEHAVIOR/SINGLE DAY

If <u>violence to victim</u>	Complete p 22
If <u>violence to other family</u>	p 23, 24
If any kind of <u>threat</u>	p 25
If <u>actual property damage</u>	p 26

Then, after doing one of these four, GO TO PAGE 32

#### B. MULTIPLE BEHAVIORS/SINGLE DAY ONLY

Suppose that nothing happens for 4 days after the Presenting Incident.

Then, on the 5th day after the PI, victim is hit, the male threatens to hurt one of the kids, and he does some property damage...thus, three different behaviors on the first occurrence day.

Your task is to select the most serious of what has actually

happened on that same day (e.g. the 5th day) and complete the appropriate set of questions.

USE THE SERIOUSNESS SEQUENCE INDICATED ABOVE IN A, COMPLETE ONE OF THE 4SETS OF QUESTIONS, THEN GO TO PAGE 32.

C. SINGLE BEHAVIOR ONLY/MULTIPLE DAYS

Suppose that during the time between the Presenting incident and the first interview that V was slapped on the 3rd day, punched on the 9th day, slapped again on the 10th day, and kicked on the 12th day. Suppose further that the first interview is being conducted on the 20th day after the PI.

This case would be considered to be a SINGLE type of behavior (i.e., everything that happened fits in the violence against victim category which occurred on MULTIPLE DAYS.

Select the FIRST OCCURRENCE of this and select the MOST RECENT OCCURRENCE OF THIS, and for each of these two occurrences complete the appropriate set of questions.

	FIRST	AND	RECENT
If <u>violence against victim</u>	22		27
If <u>violence against other</u>	23, 24		28, 29
If any kind of <u>threat</u>	25		30
If actual <u>property damage</u>	26		31

THEN GO TO PAGE 32

D. MULTIPLE BEHAVIOR/MULTIPLE DAYS

These instructions are basically a combination of B and C.

EXAMPLE

Suppose that the FIRST OCCURRENCE of anything is the 4th day after the PI, and the victim is threatened; on the 8th day he threatens her and hits her; on the 12th day he damages her car. It is now the 13th day since the PI.

:You select the first occurrence (victim threat) and ask the appropriate set of questions from the FIRST OCCURRENCE set. Since the incident on the 8th day is neither the FIRST nor the MOST RECENT, we skip that here and go on to the MOST RECENT (damage to car) and ask the damage set of questions for the MOST Recent occurrence.

COMPLETE EACH OF THESE TWO CATEGORIES, THEN GO TO PAGE 32

EXAMPLE

Suppose that the FIRST OCCURRENCE of anything is on the 8th day after the PI. There is violence against victim and property damage; on the 10th. day there is a threat against her; on the 14th day he hits one of the kids; on the 18th day he threatens victim. It is now the 21st day after the PI.

:The 8th day constitutes the first occurrence. You have to select the most serious type of behavior that has happened (in this case violence against victim is more serious than property damage) if more than one thing has happened on the FIRST OCCURRENCE day. Complete the appropriate questions on the most serious of the four types of behaviors. We skip the middle two incidents, and go to the MOST RECENT (on the 18th day) and ask the damage questions from this set. Had there been a more serious occurrence on the 18th day, we would choose to ask about that instead.

COMPLETE THE TWO MOST APPROPRIATE CATEGORIES  
THEN GO TO PAGE 32

INTERVIEWER

If there has been an episode of "violence against victim" (a "yes" to question 259 on p. 19) which will not be captured with detailed questions in either the FIRST occurrence section or the MOST RECENT occurrence section, then ask the set, INTERIM VIOLENCE AGAINST VICTIM which follows the MOST RECENT occurrence set. If there has been no violence against victim, or if this will be captured, skip this page when you get to it.

SET 1. FIRST OCCURRENCEA. PHYSICAL VIOLENCE AGAINST VICTIM: FIRST OCCURRENCE

I'D LIKE TO ASK YOU A FEW MORE QUESTIONS ABOUT THE FIRST TIME HE HIT, SLAPPED, OR TRIED TO HURT YOU:

Were you hurt or injured in any of the following ways?:	<u>YES</u>	<u>NO</u>
279. Were you shot with a gun?	1	2
280. Were you cut with a knife?	1	2
281. Were you hit on the head and blacked out?	1	2
282. Did you have any broken bones or teeth?	1	2
283. Were you scratched or bruised?	1	2
284. Did you have any immediate aches or pains?	1	2
285. Did he throw something at you?	1	2
286. Did he push, grab or shove you?	1	2
287. Did he slap you?	1	2
288. Did he kick, bite, or hit you with his fist?	1	2
289. Did he hit or try to hit you with something other than hand or fist?	1	2
290. Did he choke you?	1	2
291. Did he beat you up?	1	2
292. Did he threaten you with a knife or gun?	1	2
293. Did he use a knife or gun?	1	2

INTERVIEWER: IF YES TO ANY OF THE ABOVE, ASK QUESTION 294 - 297

IF ALL NO, GO TO QUESTION 298

294. Were you given any medical treatment (at the scene)?	1	2
295. Were you offered treatment (at the scene but decided against it?)	1	2
296. Were you taken to the hospital?	1	2
IF YES to HOSPITAL, ASK: 297		
297. Did you stay overnight at the hospital?	1	2
298. During this incident, were the police called?	1	2
IF YES, ASK QUESTION 299.		
299. Who called the police?		
1. Victim		
2. Child		
3. Other family member		
4. Neighbor		
5. Friend		
6. Don't know		
7. Other Specify _____		

INTERVIEWER: If there has been a MOST RECENT occurrence of anything, go to the appropriate page in that section. If there has been no MOST RECENT occurrence of anything, go to INTERIM VIOLENCE page or Section G (page 33).

B. PHYSICAL VIOLENCE AGAINST OTHER FAMILY: FIRST OCCURRENCE

You mentioned that \_\_\_\_\_ days after the police were here he didn't hurt you, but that he hurt you or tried to hurt another family member?

300. Who was it that he hit, slapped, hurt or tried to hurt?  
(CIRCLE ALL THAT APPLY)

- |                  |                              |
|------------------|------------------------------|
| 1. Victim child  | 5. Partner parent            |
| 2. Partner child | 6. Victim other relative     |
| 3. Joint child   | 7. Other family: Specify who |
| 4. Victim parent |                              |

8. Other non-relative: Specify  
who \_\_\_\_\_

INTERVIEWER: IF ONLY ONE FAMILY MEMBER HURT, GO TO Q. 303  
IF MORE THAN ONE PERSON HURT, ASK Q. 301

301. Ok, he went after \_\_\_\_\_ and \_\_\_\_\_ and

\_\_\_\_\_. Who would you say was hurt the most, or who did he try to hurt the most?

- |                  |                               |
|------------------|-------------------------------|
| 1. Victim child  | 5. Partner parent             |
| 2. Partner child | 6. Victim other relative      |
| 3. Joint child   | 7. Other family: Specify who: |
| 4. Victim parent |                               |

8. Other non-relative: Specify  
\_\_\_\_\_

IF A CHILD WAS HURT, THE FOLLOWING QUESTIONS SHOULD BE ASKED WITH THE CHILD AS THE "MOST HURT" PERSON," EVEN IF SOMEONE ELSE WAS ALSO HURT.

EXCEPTION TO THIS: IF THERE IS A BIG DIFFERENCE BETWEEN WHAT HAPPENED TO CHILD AND WHAT HAPPENED TO ANOTHER (e.g. VICTIM MOTHER), WITH THE OTHER PERSON CLEARLY BEING THE "MOST HURT" PERSON, THEN ASK THE "MOST HURT" QUESTIONS ABOUT THE OTHER

302. CODE HERE \_\_\_\_\_ WHO THE FOLLOWING ANSWERS REFER TO

SAME AS ABOVE: MOST HURT = 1 2 3 4 5 6 7 8

Was (Most hurt person) \_\_\_\_\_ hurt or injured in any of the following ways?

	YES	NO
303. Was he/she shot with a gun?	1	2
304. Was he/she cut with a knife?	1	2
305. Was he/she hit on the head and blacked out?	1	2
306. Did he/she have any broken bones or teeth?	1	2
307. Was he/she scratched or bruised?	1	2

	<u>YES</u>	<u>NO</u>
308. Did he/she have any immediate aches or pains?	1	2
309. Did he/she throw something at him/her?	1	2
310. Did he/she push, grab or shove him/her?	1	2
311. Did he/she slap him/her?	1	2
312. Did he/she kick, bite, or hit him/her with his/her fist?	1	2
313. Did he/she hit or try to hit him/her with something other than hand or fist?	1	2
314. Did he/she choke him/her?	1	2
315. Did he/she beat him/her up?	1	2
316. Did he/she threaten him/her with a knife or gun?	1	2
317. Did he/she use a knife or gun?	1	2

INTERVIEWER: IF YES TO ANY OF THE ABOVE, ASK QUESTION  
318 - 321

IF ALL NO, GO TO QUESTION 322.

318. Was he/she given any medical treatment (at the scene)?	1	2
319. Was he/she offered treatment (at the scene but decided against it)?	1	2
320. Was he/she taken to the hospital?	1	2

IF YES to HOSPITAL, ASK: 321.

321. Did he/she stay overnight at the hospital?	1	2
322. During this incident, were the police called?	1	2

IF YES, ASK QUESTION 323.

323. Who called the police?

- |                        |                        |
|------------------------|------------------------|
| 1. Victim              | 4. Neighbor            |
| 2. Child               | 5. Friend              |
| 3. Other family member | 6. Don't know          |
|                        | 7. Other Specify _____ |

INTERVIEWER: If there has been a MOST RECENT occurrence of anything, go to the appropriate page in that section. If there has been no MOST RECENT occurrence of anything, go to INTERIM VIOLENCE page or to Section G (page 33).

C. THREATS: FIRST OCCURRENCE

During this incident what did he/your partner threaten to do?

Did he...	<u>YES</u>	<u>NO</u>
324. Threaten to hurt you?	1	2
325. Threaten to physically hurt a child?	1	2
326. Threaten anyone with a knife or gun?	1	2
327. Threaten anyone with another weapon?	1	2
328. Threaten to hurt another family member/ or to hurt them worse?	1	2
329. Threaten to leave you?	1	2
330. Threaten you if you called the police?	1	2
331. Threaten to damage property around the house?	1	2
332. Threaten to kill himself?	1	2
333. Threaten to kill you?	1	2
334. Threaten to do something else?	1	2

334a. SPECIFY: \_\_\_\_\_

335. During this incident, were the police called? 1 2

336. IF YES, ASK: Who called the police?

- |                        |                         |
|------------------------|-------------------------|
| 1. Victim              | 4. Neighbor             |
| 2. Child               | 5. Friend, not neighbor |
| 3. Other family member | 6. Don't know           |
|                        | 7. Other Specify _____  |

INTERVIEWER: If there has been a MOST RECENT occurrence of anything, go to the appropriate page in that section. If there has been no MOST RECENT occurrence of anything, go to INTERIM VIOLENCE page or to Section G (page 33).

D. DAMAGE TO PROPERTY: FIRST OCCURRENCE

You mentioned that he damaged some property \_\_\_\_\_ days after the police were here.

337. During that incident, what was it that he damaged?

---

INTERVIEWER: IF OWNERSHIP ABSOLUTELY CLEAR, SIMPLY CODE THIS ANSWER. IF OWNERSHIP UNCLEAR, ASK:

338. Was this pretty much your own, or his, or was it something you shared in common?

1. Victim's            2. Partners            3. Shared

339. Could you guess about how much it might cost to fix or replace (item) \_\_\_\_\_?

1. less than \$10
2. \$10-49
3. \$50-99
4. \$100-199
5. \$200-249
6. \$250-499
7. \$500-999
8. \$1000

340. During this incident, were the police called?

1. Yes 2. No

341. IF YES, ASK: Who called the police?

1. Victim
2. Child
3. Other family member
4. Neighbor
5. Friend, not neighbor
6. Don't know
7. Other Specify \_\_\_\_\_

INTERVIEWER: If there has been a MOST RECENT occurrence of anything, go to the appropriate page in that section. If there has been no MOST RECENT occurrence of anything, go to INTERIM VIOLENCE page or to Section G (page 33).

## SET 2. MOST RECENT OCCURRENCE

A. PHYSICAL VIOLENCE AGAINST VICTIM: MOST RECENT

INTERVIEWER: MAKE SURE VICTIM KNOWS WHAT DAY WE'RE TALKING ABOUT HERE

I'D LIKE TO ASK YOU A FEW MORE QUESTIONS ABOUT THIS TIME  
HE HIT, SLAPPED, OR TRIED TO HURT YOU:

Were you hurt or injured in any of the following ways?:	<u>YES</u>	<u>NO</u>
342. Were you shot with a gun?	1	2
343. Were you cut with a knife?	1	2
344. Were you hit on the head and blacked out?	1	2
345. Did you have any broken bones or teeth?	1	2
346. Were you scratched or bruised?	1	2
347. Did you have any immediate aches or pains?	1	2
348. Did he throw something at you?	1	2
349. Did he push, grab or shove you?	1	2
350. Did he slap you?	1	2
351. Did he kick, bite, or hit you with his fist?	1	2
352. Did he hit or try to hit you with something other than hand or fist?	1	2
353. Did he choke you?	1	2
354. Did he beat you up?	1	2
355. Did he threaten you with a knife or gun?	1	2
356. Did he use a knife or gun?	1	2

INTERVIEWER: IF YES TO ANY OF THE ABOVE, ASK QUESTION  
357.

IF ALL NO, GO TO QUESTION 361.

357. Were you given any medical treatment (at the scene)?	1	2
358. Were you offered treatment (at the scene but decided against it?)	1	2
359. Were you taken to the hospital?	1	2

IF YES to HOSPITAL, ASK: 360.

360. Did you stay overnight at the hospital?	1	2
361. During this incident, were the police called?	1	2

IF YES, ASK QUESTION 362:

362. Who called the police?

- |                        |                        |
|------------------------|------------------------|
| 1. Victim              | 4. Neighbor            |
| 2. Child               | 5. Friend              |
| 3. Other family member | 6. Don't know          |
|                        | 7. Other Specify _____ |

INTERVIEWER: Go to INTERIM VIOLENCE page or to Section G (page 33)

A. PHYSICAL VIOLENCE AGAINST OTHER FAMILY: MOST RECENT OCCURRENCE  
 INTERVIEWER: MAKE SURE VICTIM KNOWS WHAT DAY WE'RE TALKING ABOUT

You mentioned that \_\_\_\_\_ days after the police were here he hurt or tried to hurt another family member?

363. Who was it that he hit, slapped, hurt or tried to hurt?

(CIRCLE ALL THAT APPLY)

1. Victim child
2. Partner child
3. Joint child
4. Victim parent
5. Partner parent
6. Victim other relative
7. Other family: Specify who: \_\_\_\_\_

INTERVIEWER: IF ONLY ONE FAMILY MEMBER HURT, GO TO Q. 366  
 IF MORE THAN ONE PERSON HURT, ASK Q. 364

Ok, he went after \_\_\_\_\_ and \_\_\_\_\_ and

364. \_\_\_\_\_. Who would you say was hurt the most, or who did he try to hurt the most?

1. Victim child
2. Partner child
3. Joint child
4. Victim parent
5. Partner parent
6. Victim other relative
7. Other family: Specify who: \_\_\_\_\_

IF A CHILD WAS HURT, THE FOLLOWING QUESTIONS SHOULD BE ASKED WITH THE CHILD AS THE "MOST HURT" PERSON, "EVEN IF SOMEONE ELSE WAS ALSO HURT.

EXCEPTION TO THIS: IF THERE IS A BIG DIFFERENCE BETWEEN WHAT HAPPENED TO CHILD AND WHAT HAPPENED TO ANOTHER (e.g. VICTIM MOTHER), WITH THE OTHER PERSON CLEARLY BEING THE "MOST HURT" PERSON, THEN ASK THE "MOST HURT" QUESTIONS ABOUT THE OTHER

365. CODE HERE \_\_\_\_\_ WHO THE FOLLOWING ANSWERS REFER TO

SAME AS ABOVE MOST HURT = 1 2 3 4 5 6 7 8

Was (Most hurt person) \_\_\_\_\_ hurt or injured in any of the following ways?

	<u>YES</u>	<u>NO</u>
366. Was he/she shot with a gun?	1	2
367. Was he/she cut with a knife?	1	2
368. Was he/she hit on the head and blacked out?	1	2
369. Did he/she have any broken bones or teeth?	1	2
370. Was he/she scratched or bruised?	1	2

	<u>YES</u>	<u>NO</u>
371. Did he/she have any immediate aches or pains?	1	2
372. Did he/she throw something at him/her?	1	2
373. Did he/she push, grab or shove him/her	1	2
374. Did he/she slap him/her?	1	2
375. Did he/she kick, bite, or hit him/her with his/her fist?	1	2
376. Did he/she hit or try to hit him/her with something other than hand or fist?	1	2
377. Did he/she choke him/her?	1	2
378. Did he/she beat him/her up?	1	2

425. INTERVIEWER: Enter the number of days of this incident after the Presenting Incident here \_\_\_\_\_ (01-999)

SECTION G: RELATIONSHIP ABUSE HISTORY

Now what I'd like to do is get an idea of what your relationship's been like BEFORE the police were here the other day/night (time of presenting incident).

INTERVIEWER: PRECEDE EACH ITEM WITH

In the 6 months before the Presenting Incident about how many separate times has he?:

1 2 3 4 5 6 7 8 9 or more

AND THEN, About how many separate times has he done this since you've known him? (0-99)

Last 6 months | Total

426-427 Threatened to hurt you in any way?	_____		_____
428-429 Actually hit you, slapped you, hurt or tried to hurt you in some way?	_____		_____
430-431 Threatened to hurt another family member?	_____		_____
432-433 Actually hit, slapped, hurt or tried to hurt another member of your family?	_____		_____
434-435 Threatened to damage property?	_____		_____
436-437 Actually damaged property?	_____		_____

IF ANY OCCURRENCE, ASK:

438. In the last 6 months, about how often have you called the police, because of problems with him?

0 1 2 3 4 5 6 or more

439. About how many times since you've known him?

0 1 2 3 4 5 6 or more

SECTION H: FAMILY BACKGROUND AND EARLY ABUSE HISTORYVICTIM FAMILY BACKGROUND

I'd like to get a little information on what your family was like.  
Could you tell me which of the following you lived with?

Did you live with your...

	<u>YES</u>	<u>NO</u>
440. Mother	1	2
441. Father	1	2
442. Stepmother	1	2
443. Stepfather	1	2
444. Older brothers	1	2
445. Older sisters	1	2
446. Younger brothers	1	2
447. Younger sisters	1	2
448. Stepbrothers	1	2
449. Stepsisters	1	2
450. Half-brothers	1	2
451. Half-sisters	1	2
452. Any grandparents	1	2
453. Any cousins or other kin	1	2

454. From the time you were born until about age six,  
what parents were you mainly living with?

1. Mother mainly
2. Father mainly
3. Mother + father
4. Mother + stepfather
5. Father + stepmother
6. Other Specify \_\_\_\_\_

455. After about age six, what parents did you mainly live with?

1. Mother mainly
2. Father mainly
3. Mother + father
4. Mother + stepfather
5. Father + stepmother
6. Other \_\_\_\_\_

456. While you were growing up, was your mother ever slapped, hit, or hurt by your father/stepfather?

1. Yes
2. No

457. IF YES: Was this once or twice, three to five times or six times or more?

1. Once or twice
2. Three to five
3. Six or more

458. How often did your mother call the police to complain?

1. Never
2. Once or twice
3. Three to five
4. Six or more

459. If appropriate: How often was your father/stepfather ever arrested for abusing your mother:

1. Never
2. Once or twice
3. Three to five
4. Six or more

460. Overall, how would you describe your parents' relationship during your growing up years?

Would you say it was...

1. Very happy
2. Happy
3. Mixed
4. Unhappy, or
5. Very unhappy

Now I'd like to ask you a few questions about growing up experiences, first, things that happened to you before you turned 18 years old.

About how often would you say each of the following happened to you... Would you say once or twice, a few times, or six times or more, or perhaps never...?

Before 18, how often did someone in your family, or a relative or someone else...

FREQUENCY CODE

- 0. Never
- 1. Once or twice
- 2. 3-5 times
- 3. 6 or more times

	(1) Frequency Code	(2) Relationship Code	(3) First Age (0-18)
461. Throw something at you?	_____	_____	_____
462. Push, grab or shove you?	_____	_____	_____
463. Slap you?	_____	_____	_____
464. Kick, bite or hit you with a fist?	_____	_____	_____
465. Hit or try to hit you with some thing? (other than hand or fist)	_____	_____	_____
466. Choke you?	_____	_____	_____
467. Beat you up?	_____	_____	_____
468. Threaten you with a knife or gun?	_____	_____	_____
469. Use a knife or gun (against you)	_____	_____	_____
470. Grab you or feel you or kiss you in a way that was sexually threatening?	_____	_____	_____
471. Try or succeed in touching your breasts or genitals against your will?	_____	_____	_____
472. Try or succeed in getting you to touch their genitals against your will?	_____	_____	_____
473. Try or succeed in getting you to have intercourse against your will?	_____	_____	_____

AFTER COMPLETING THE LIST, GO BACK TO ANY POSITIVE ITEM AND ASK:  
Who was it that \_\_\_\_\_(item).

USE THE FOLLOWING CODES AND ENTER IN RELATIONSHIP COLUMN. IF MORE  
THAN ONE PERSON, ASK WHO DID IT MOST OFTEN AND ENTER THIS CODE FIRST,  
WITH OTHERS FOLLOWING.

- |                              |                                      |
|------------------------------|--------------------------------------|
| 1. Mother                    | 9. Other family relative             |
| 2. Father                    | 10. Dating person                    |
| 3. Brother                   | 11. Cohabiting Relationship-Previous |
| 4. Sister                    | 12. Cohabiting Relationship-Present  |
| 5. Stepfather                | 13. Husband-Previous                 |
| 6. Stepmother                | 14. Husband-Present                  |
| 7. Step sibling/half sibling | 15. Stranger                         |
| 8. Uncle, grandfather        | 16. Other:Specify _____              |

THEN ASK, HOW OLD WERE YOU WHEN THIS FIRST HAPPENED? ENTER AGE IN  
COLUMN 3.

SECTION I: ALCOHOL USE

We're almost through now, there's just a little bit left to ask.

474. Would you say that your \_\_\_\_\_ has any problem with alcohol, or drug use or perhaps both?
- |            |            |
|------------|------------|
| 1. Alcohol | 3. Both    |
| 2. Drugs   | 4. Neither |
475. IF BOTH: Would you say that his major problem is with alcohol or drugs...or about the same?
- |            |          |         |
|------------|----------|---------|
| 1. Alcohol | 2. Drugs | 3. Same |
|------------|----------|---------|
476. In general, how often does he consume alcoholic beverages--that is, beer, wine or liquor? Would you say:
- |                                |                  |
|--------------------------------|------------------|
| 1. Never                       | 4. 1-2 days/week |
| 2. Less than one day per month | 5. 3-4 days/week |
| 3. 1-3 days/month              | 6. 5-6 days/week |
|                                | 7. Daily         |
477. On a day when he does drink alcoholic beverages, on the average, how many drinks does he have? By a "drink" we mean 12 oz. of beer, or 1-1/2 ozs. of hard liquor or 5 oz. of wine?  
 \_\_\_ number of drinks when drinking (0-99)
478. About how often does he get drunk? Would you say:
- |                 |                  |
|-----------------|------------------|
| 1. Never        | 4. Often         |
| 2. Rarely       | 5. Very often    |
| 3. Occasionally | 6. Almost always |
479. In general, how often do you consume alcoholic beverages?
- |                                |                  |
|--------------------------------|------------------|
| 1. Never                       | 4. 1-2 days/week |
| 2. less than one day per month | 5. 3-4 days/week |
| 3. 1-3 days/month              | 6. 5-6 days/week |
|                                | 7. Daily         |
480. On a day when you drink alcoholic beverages, on the average how many drinks do you have?  
 \_\_\_ number of drinks when drinking (0-9)
481. About how often do you get drunk:
- |                 |                  |
|-----------------|------------------|
| 1. Never        | 4. Often         |
| 2. Rarely       | 5. Very often    |
| 3. Occasionally | 6. Almost always |

482. Has he used any of the following drugs in the last six months?

	<u>YES</u>	<u>NO</u>	<u>FREQUENCY CODE</u>
482. Heroin, methadone, other narcotics. Slang:	1	2	_____
483. Cocaine. Slang:	1	2	_____
484. Crack	1	2	_____
485. Marijuana/hashish. Slang:	1	2	_____

## ALCOHOL LEGITIMACY SCALE

I'd like to read several statements and for each, would you please tell me if you STRONGLY AGREE, AGREE, DISAGREE, STRONGLY DISAGREE, OR DON'T KNOW. (give card with possible responses)

492. Wives should not hold alcoholic husbands responsible for what they do. SA A D SD DK
493. My relationship with my husband (or boyfriend) would be better if he didn't drink. SA A D SD DK
494. I can imagine situations in which it's okay for a man to slap his girlfriend. SA A D SD DK
495. A wife should accept her husband's bad moods if he's been drinking. SA A D SD DK
496. I cannot imagine a situation in which it's okay for a woman to slap her husband/boyfriend. SA A D SD DK
497. When women drink a lot, they should still be responsible for what they do or say. SA A D SD DK
498. Most people don't really know what they're doing when they've had a lot to drink. SA A D SD DK
499. I cannot imagine a situation in which it's okay for a man to slap his wife. SA A D SD DK
500. When women drink a lot, they do not really mean it if they act tough or hostile to men. SA A D SD DK
501. It's okay for a man to slap his wife in self-defense or if she is hysterical. SA A D SD DK
502. In situations in which a married couple disagrees, the wife should usually go along with her husband's wishes. SA A D SK DK
503. When men drink a lot they really mean it if they act tough or hostile to women. SA A D SK DK
504. It's a wife's obligation to forgive her husband if he slapped her while under the influence of alcohol. SA A D SK DK
505. Husbands should hold alcoholic wives responsible for what they do. SA A D SK DK

SECTION J: VICTIM'S HELP-SEEKING ACTION

Sometimes people try different kinds of help in dealing with problems of abuse in relationships. Could you tell me how many times you have ever done any of these because of an abuse problem...never, once, twice...or, however many times it has been:

ENTER ACTUAL FREQUENCY IN COL. 1

	(1) Total <u>Times</u>
506. Talked to a counselor or social work person. (01)	_____
507. Talked to a minister. (02)	_____
508. Talked to a lawyer or another type of legal person. (03)	_____
509. Phoned someone at the Victim's Assistance Program (04)	_____
510. Gone to the Victim's Assistance to talk with someone. (05)	_____
511. Called to a Shelter for Battered Women. (06)	_____
512. Gone to the Shelter just to talk. (07)	_____
513. Stayed overnight at the Shelter. (08)	_____
514. Called the police yourself because of a problem. (09)	_____
515. Gone to see a Magistrate or Clerk but without actually signing a complaint or warrant. (10)	_____
516. Saw a Magistrate or Clerk and signed a complaint or warrant. (11)	_____
517. Appeared in Court as a Victim of Spouse Abuse. (12)	_____

IF YES TO ANY OF THE ABOVE:

518. Did any of these help reduce the abuse problems for at least a while?  
1. Yes 2. No.

IF YES, WHAT SEEMED TO HELP

519. ENTER UP TO 3 CODES HERE OF ACTIONS THAT HELPED

INTERVIEWER: CODES APPEAR IN BRACKETS

\_\_\_\_\_

SECTION K

520. Are you working full time, part time, or not at all right now?  
1. Full time 2. Part time 3. Not working

521. When you are working, what do you do? \_\_\_\_\_

522. How about your husband/partner, is he working full time, part time or not at all right now?  
1. Full time 2. Part time 3. Not at all

523. IF NOT WORKING: How long has he been unemployed?

\_\_\_\_\_  
(0-99 weeks)

524. When he is working, what is his main occupation...what does he do?  
\_\_\_\_\_

525. Could you tell me about what your monthly take home pay is (OR, IF NOT WORKING NOW,.....was the last time you were working? \$ \_\_\_\_\_/month

526. Could you tell me about what \_\_\_\_\_'s monthly take home pay is (OR, IF NOT WORKING NOW,.....was the last time he was working?

\$ \_\_\_\_\_/month

527. Who pays the mortgage/rent here...is it mainly you, mainly your \_\_\_\_\_, or is it pretty much joint?  
1. Victim 2. Partner 3. Joint

528. Do you (OR, Do you and \_\_\_\_\_) receive any type of public assistance or welfare money?  
1. YES 2. NO

I really can't thank you enough for taking so much time. the information you've given us is bound to be of help in trying to figure out what to do about problems of abuse. Your time and effort have really meant a lot. (OR, USE OWN WORDS).

SECTION L: INTERVIEWER IMPRESSIONS

To be completed immediately after conclusion of interview and saying goodbye to Victim.

529. What was Victim's initial (first half hour) attitude toward the interview?
1. Open and cooperative
  2. Guarded/wary
  3. Somewhat fearful
  4. Very fearful
530. What was Victim's attitude toward the interview at the end (last half hour)?
1. Open and cooperative
  2. Guarded/wary
  3. Somewhat fearful
  4. Very fearful
531. Were there others present during a major part of the interview?
1. Yes    2. No
- If yes, who? (Check all that apply)
1. Child(ren) under 6 years old
  2. Children 6-13 years old
  3. Children 13 and above
  4. Victim's partner
  5. Other family member    Who? \_\_\_\_\_
  6. Other.    Who? \_\_\_\_\_
532. Were there others present in the house/apartment during a major part of the interview, although not in immediate presence?
1. Yes    2. No
- If yes, who? (Check all that apply)
1. Child(ren) under 6 years old
  2. Children 6-13 years old
  3. Children 13 and above
  4. Victim's partner
  5. Other family member    Who? \_\_\_\_\_
  6. Other.    Who? \_\_\_\_\_
533. Do you think Victim will participate in another face-to-face interview in a few months?
- |                  |                  |
|------------------|------------------|
| 1. Very doubtful | 3. Probably      |
| 2. Doubtful      | 4. Very probably |
534. Do you think Victim would participate in a telephone interview in a few months?
- |                  |                  |
|------------------|------------------|
| 1. Very doubtful | 3. Probably      |
| 2. Doubtful      | 4. Very probably |
535. What is your estimate of family's/couple'/s SES?
1. Poverty level or close to it.
  2. Working class family
  3. Borderline working class-middle class
  4. Pretty definite middle class
  5. Upper middle class or higher

536. Did you personally feel safe conducting the interview?

- 1. Yes
- 2. No

IF NO, PLEASE EXPLAIN \_\_\_\_\_  
\_\_\_\_\_

537. How would you feel about interviewing this person again, in basically the same circumstances/surroundings?

- 1. Fine, no problem
- 2. Mixed, but probably ok
- 3. Would rather not
- 4. Do not want to

538. LENGTH OF INTERVIEW \_\_\_\_\_ MIN. (0-999)

539. # of days between Presenting Incident & interview \_\_\_\_\_

540. Date of interview \_\_\_\_\_

541. Complaint # \_\_\_\_\_

542. Interviewer ID # \_\_\_\_\_

543. Suspect ID # \_\_\_\_\_

OTHER COMMENTS

APPENDIX A - ITEM # 6

SIX MONTH INTERVIEW

INFORMED CONSENT STATEMENT

My name is \_\_\_\_\_, and I am one of the interviewers with the Charlotte Spouse Assault Study. I'd be glad to provide identification if you'd like.

As you know because of your previous participation, this study is being conducted by researchers at the University of North Carolina at Charlotte, along with the Charlotte Police Department. If you have any questions about the study, you may call Dr. Ira Hutchison at UNCC. His number is 547-2535.

The purpose of this research is to talk to women who have been involved in domestic disputes where the police have gotten involved. We are trying to find out if what the police do helps reduce further disputes or assaults. This research may not be of help to you, but hopefully it will help us find ways to cut down on the problem of domestic violence.

This interview will last about 30 minutes, and you will be paid for your time (\$25 if interviewed at home; \$30 if at office). Your participation in the interview is completely voluntary. If any of the questions or the interview itself make you uncomfortable, please tell me; you are free to skip any questions you don't like or even to cancel the interview after we have started.

Whatever you tell me will be held in total confidence. After I turn in this interview to the researchers, the cover sheet with your name is torn off and kept in a locked file. Your answers are then assigned an ID number. No one in the Charlotte Police Department will have any access to your answers. When reports are written, answers will be combined from lots of people so it is not possible to identify any individual. We are sure that we can guarantee the confidentiality of your answers.

If you would like to go ahead with the interview, I'd like to get your signature on this page to show that I have read this page to you and that you understand what we are doing. This page will be kept separate from any of your answers. Do you have any questions I might answer before we start?

---

Six Month

CASE ID NUMBER

INTERVIEWER: PLEASE FILL-IN THE BLANKS BELOW BEFORE BEGINNING WITH QUESTION #1.

We appreciate your willingness to be interviewed again.

That interview was on \_\_\_\_\_ month/day; so that time would have been about \_\_\_\_\_ months/weeks ago. What we'd like to ask about today is what's been happening since that last interview. (INTERVIEWER: IF POSSIBLE TRY TO "TIE DOWN" THE FIRST INTERVIEW TIME WITH AN EVENT: E.G. "right before Thanksgiving," or "between Christmas and New Year" or "right after the big snowstorm." (Skip this suggestion if you think V has the last interview time firmly fixed in mind).

1. At the time of that interview in \_\_\_\_\_ month you
  1. were married to
  2. were separated from
  3. were divorced from
  4. were living with \_\_\_\_\_ (NAME OF OFFENDER)
  5. had stopped living with
  
2. What is your relationship with \_\_\_\_\_ (offender) right now?
  1. Married
  2. Divorced
  3. Separated
  4. Cohabiting
  5. Ex-Cohabitants

Using the chart below, determine the relationship now and at the time of the first interview. The number you arrive at is the question number you go to next.

CHART

3. IF MARRIED OR COHABITING: Have there been any periods of time since then (the last interview) that you have been living apart?  
1. Yes 2. No GO TO Q. 30.

4. IF YES: Could you tell me if this was just one time living apart, or more than one time (IF ASKED, living apart here means for one week or more).

1 2 3 4 5 6 or more times

5. Who was it that left, you or him?  
1. Victim 2. Offender 3. Both

6. ASK MOST APPROPRIATE: Did you want him to leave/did he want you to leave?  
1. Yes 2. No

In the \_\_\_\_\_ weeks (INTERVIEWER: state number of weeks) since the last interview, how many weeks would you say you spent most of the week living together?

7. \_\_\_\_\_ number of weeks (01-99)

8. Do you remember when he/you first left?

\_\_\_\_\_ Date  
month day year

9. Do you remember when he/you returned that time?

\_\_\_\_\_ Date  
month day year

What caused you two to split up for awhile, was it one thing or several things?

INTERVIEWER: (USE THE CODES INDICATED BELOW)

| 3. His drinking/drugs              | 15. Her drinking/drugs            |
| 4. His treatment of kids           | 16. Her treatment of kids         |
| 5. His extramarital or other women | 17. Her extramarital or other men |
| 6. His treatment of kin            | 18. Her treatment of kin          |
| 7. His friends                     | 19. Her friends                   |
| 8. His household tasks             | 20. Her household tasks           |
| 9. His nagging                     | 21. Her nagging                   |
| 10. His work around house          | 22. Her work around house         |
| 11. His alimony/support payments   | 23. Her alimony/support payments  |
| 12. His abusiveness                | 24. Her abusiveness               |
| 25. Other _____                    |                                   |

IF PHYSICAL ABUSE IS NOT MENTIONED, ASK:

14. Was his physical abuse any part of the reason for living apart for awhile?  
1. Yes 2. No

IF VERBAL ABUSE IS NOT MENTIONED, ASK:

15. Was his verbal abuse any part of the reason for living apart for awhile?  
1. Yes 2. No

SKIP IF BLATANTLY OBVIOUS: Since the last interview, would you say your relationship has been under a lot of stress, moderate stress, or relatively little stress or no stress?

16a. VICTIM ANSWER

1. lot 2. moderate 3. little 4. none

IF BLATANTLY OBVIOUS

16b. INTERVIEWER ANSWER

1. Lot 2. Moderate 3. Little 4. None

SKIP IF BLATANTLY OBVIOUS: Since the last interview, how would you describe your relationship with him?

17a. VICTIM ANSWER

1. very satisfying 3. somewhat dissatisfying  
2. somewhat satisfying 4. very dissatisfying

IF BLATANTLY OBVIOUS

17b. INTERVIEWER ANSWER

1. very satisfying 3. somewhat dissatisfying  
2. somewhat satisfying 4. very dissatisfying

THIS CONCLUDES THE INTRODUCTORY SECTION FOR CURRENTLY MARRIED OR CURRENTLY COHABITING COUPLES: I.E. COUPLES WHO WERE MARRIED AT THE TIME OF THE FIRST INTERVIEW AND ARE STILL MARRIED NOW; SAME THING FOR COHABITING COUPLES

18. IF RELATIONSHIP STATUS UNCHANGED (EXCLUDES MARRIED AND COHABS)

Since the last interview, have you had any periods of time while you and \_\_\_\_\_ (offender) were living together?

1. Yes 2. No GO TO Q. 20

19. IF YES: In the \_\_\_\_\_ weeks (Interviewer: state number of weeks) since the last interview, how many weeks would you say you spent most of the week living together?  
number of weeks \_\_\_\_\_ (1-99)

20. Since the last interview, about how many days or evenings have you spent together? (This means time spent together but not living together?)  
number of days/evenings \_\_\_\_\_ (0-999)

IF RELATIONSHIP STATUS CHANGED:

EXAMPLES: WERE married NOW divorced/separated  
WERE cohabitants NOW ex-cohabitants

21. ASK: Who was it that changed the relationship, mainly you or him?

1. Victim 2. Offender 3. Both

22. In the \_\_\_\_\_ weeks (INTERVIEWER: state number of weeks since the last interview, how many weeks would you say you spent most of the week living together?

number of weeks \_\_\_\_\_ (1-99)

What caused you to split up? Was it one thing or several things?

25. Other \_\_\_\_\_

27. Was his physical abuse any part of the reason?

- 1. Yes 2. No

IF VERBAL ABUSE IS NOT MENTIONED, ASK:

28. Was his verbal abuse any part of the reason?

- 1. Yes 2. No

29. INTERVIEWER: Does one of the preceding sets of questions adequately capture the relationship status of this victim?

- 1. Yes 2. No

IF NO: Please Describe

\_\_\_\_\_

\_\_\_\_\_

\_\_\_\_\_

Now I'd like to ask you about what's been happening in the time we've been talking about. So these questions are all about what's happened in the last weeks/months since the first interview.

30. Since then, has he THREATENED to hurt you in any way?

1. Yes 2. No 9. DK

IF NO, GO TO Q. 34

IF YES, ASK 31-33

31. How many separate times has this happened?

1 2 3 4 5 or more 8 NA 9 DK

32. How soon was it after the interview we've been talking about was it that he first threatened you?

I: ENTER EXACT NUMBER OF WEEKS AFTER FI THAT FIRST THREAT OCCURRED \_\_\_\_\_ WEEKS (1-99)

33. IF MORE THAN ONE THREAT, ASK: When was it that he most recently threatened you?

I: SAME INSTRUCTIONS AS ABOVE \_\_\_\_\_ WEEKS (1-99)

34. Since the interview, has he ACTUALLY hit you, slapped you or tried to hurt you in any way?

1 Yes 2 No 9 DK

IF NO, GO TO Q. 38

IF YES, ASK 35

35. How many separate times has he done this?

1 2 3 4 5 or more 9 DK

36. How soon (after the first interview) was it that he did this the FIRST time?

I: ENTER EXACT NUMBER OF WEEKS AFTER FI THAT V WAS HIT, SLAPPED, HURT OR TRIED TO HURT \_\_\_\_\_ WEEKS (1-99)

37. IF MORE THAN ONE HIT, ETC., ASK: When was the most recent time that he did this?

I: SAME INSTRUCTIONS AS ABOVE \_\_\_\_\_ WEEKS (1-99)

38. Since the (first interview), has he THREATENED to hurt any member of the family?

1 Yes 2 No 9 DK

IF NO, GO TO Q. 42

IF YES, ASK 39 - 41

39. How many separate times has he done this (since FI)?

1 2 3 4 5 or more 8 NA 9 DK

40. How soon (after PI) was it that he FIRST threatened someone?

I: ENTER EXACT NUMBER OF WEEKS HERE \_\_\_\_\_ WEEKS (1-99)

41. IF MORE THAN ONE THREAT, ASK: When was the most recent time that he's threatened someone?

I: SAME INSTRUCTIONS AS ABOVE \_\_\_\_ WEEKS (1-99)

42. Since the incident we've been talking about, has he ACTUALLY hit, slapped, hurt or tried to hurt any member of the family?  
1 Yes 2 No 9 DK

IF NO, GO TO 46

IF YES, ASK 43-45

43. How many separate times has he done this to a family member?

1 2 3 4 5 or more 8 NA 9 DK

44. How soon was it (after FI) that he FIRST did this?

I: ENTER EXACT NUMBER OF WEEKS HERE \_\_\_\_ WEEKS (1-99)

45. IF MORE THAN ONE EPISODE, ASK: When was the most recent time that he's done this?

I: SAME INSTRUCTIONS AS ABOVE \_\_\_\_ WEEKS (1-99)

46. Has he THREATENED to damage any property (since the FI)?

1 Yes 2 No 9 DK

IF NO, GO TO Q. 50

IF YES, ASK 47 - 49

47. How many separate times has he made this kind of a threat (since the FI)?

1 2 3 4 5 or more 8 NA 9 DK

48. How soon was it (after the FI) that he FIRST threatened to damage property?

I: ENTER EXACT NUMBER OF WEEKS HERE \_\_\_\_ WEEKS (1-99)

49. IF MORE THAN ONE EPISODE OF THREATENED DAMAGE, ASK: When was the most recent time that he's made such a threat?

I: ENTER EXACT NUMBER OF WEEKS HERE \_\_\_\_ WEEKS (1-99)

50. Since the (first interview), has he ACTUALLY damaged any property?

1 Yes 2 No 9 DK

IF NO, GO TO NEXT PAGE

IF YES, ASK 51 - 53

51. How many separate times has he actually done some damage to property (since the FI)?

1 2 3 4 5 or more 8 NA 9 DK

52. How soon was it (after FI) that he first did some property damage?

I: ENTER EXACT NUMBER OF WEEKS AFTER FI \_\_\_\_\_(1-99)

53. IF MORE THAN ONE EPISODE OF PROPERTY DAMAGE, ASK: When was the most recent time that he's damaged some property?

I: ENTER EXACT NUMBER OF WEEKS AFTER FI\_\_\_\_(1-99)

INTERVIEWER

The goal of this section is to get more detailed information on the FIRST OCCURRENCE of anything after the first interview, and - if there has been more than one repeat - detailed information on the MOST RECENT OCCURRENCE of anything.

IF THERE HAVE BEEN NO REPEAT INCIDENTS...GO TO PAGE 19

IF THERE HAS BEEN ANY REPEAT INCIDENT, READ BELOW:

The possibilities are:

- A. Single behavior only      e.g. only one type of behavior  
Single day only                      on only one day.
- B. Multiple behaviors      e.g. victim is threatened AND he  
Single day only                      also threatens one of the kids,  
but both happen on the same day.
- C. Single behavior only      e.g. victim is hurt on two different  
Multiple days                      days.
- D. Multiple behaviors      e.g. Case 1: victim is threatened and  
Multiple days                      hurt on the same day; three days  
later he threatens one of the kids  
  
Case 2: on one day, the victim is  
actually hurt, on another day he  
threatens property damage, on  
another day he threatens victim.

A. SINGLE BEHAVIOR/SINGLE DAY

- If violence to victim      Complete p 9
- If violence to other family      p 10, 11
- If any kind of threat      p 12
- If actual property damage      p 13

Then, after doing one of these four, GO TO PAGE 19

B. MULTIPLE BEHAVIORS/SINGLE DAY ONLY

Suppose that nothing happens for 4 days after the First Interview.

Then, on the 5th day after the FI, victim is hit, the male threatens to hurt one of the kids, and he does some property damage...thus, three different behaviors on the first occurrence day.

Your task is to select the most serious of what has actually

happened on that same day (e.g. the 5th day) and complete the appropriate set of questions.

USE THE SERIOUSNESS SEQUENCE INDICATED ABOVE IN A, COMPLETE ONE OF THE 4SETS OF QUESTIONS, THEN GO TO PAGE 18.

C. SINGLE BEHAVIOR ONLY/MULTIPLE WEEKS

Suppose that in the time since the first interview that V was slapped in the 3rd week, punched in the 9th week, slapped again on the 10th week, and kicked in the 12th week. Suppose further that the second interview is being conducted on the 15th week after the FI.

This case would be considered to be a SINGLE type of behavior (i.e., everything that happened fits in the violence against victim category which occurred on MULTIPLE DAYS.

Select the FIRST OCCURRENCE of this and select the MOST RECENT OCCURRENCE OF THIS, and for each of these two occurrences complete the appropriate set of questions.

	FIRST	AND	RECENT
If <u>violence against victim</u>	9		14
If <u>violence against other</u>	10, 11		15, 16
If any kind of <u>threat</u>	12		17
If actual <u>property damage</u>	13		18

THEN GO TO PAGE 19

D. MULTIPLE BEHAVIOR/MULTIPLE DAYS

These instructions are basically a combination of B and C.

EXAMPLE

Suppose that the FIRST OCCURRENCE of anything is the 4th day after the PI, and the victim is threatened; on the 8th week he threatens her and hits her; on the 12th week he damages her car. It is now the 13th week since the FI.

:You select the first occurrence (victim threat) and ask the appropriate set of questions from the FIRST OCCURRENCE set. Since the incident on the 8th week is neither the FIRST nor the MOST RECENT, we skip that here and go on to the MOST RECENT (damage to car) and ask the damage set of questions for the MOST Recent occurrence.

COMPLETE EACH OF THESE TWO CATEGORIES, THEN GO TO PAGE 19

EXAMPLE

Suppose that the FIRST OCCURRENCE of anything is on the 8th week after the FI. There is violence against victim and property damage; on the 10th. week there is a threat against her; on the 14th week he hits one of the kids; on the 18th week he threatens victim. It is now the 21st week after the FI.

:The 8th week constitutes the first occurrence. You have to select the most serious type of behavior that has happened (in this case violence against victim is more serious than property damage) if more than one thing has happened on the FIRST OCCURRENCE day. Complete the appropriate questions on the most serious of the four types of behaviors. We skip the middle two incidents, and go to the MOST RECENT (on the 18th week) and ask the damage questions from this set. Had there been a more serious occurrence on the 18th week, we would choose to ask about that instead.

COMPLETE THE TWO MOST APPROPRIATE CATEGORIES  
THEN GO TO PAGE 19

INTERVIEWER

If there has been an episode of "violence against victim" (a "yes" to question 34 on p. 6) which will not be captured with detailed questions in either the FIRST occurrence section or the MOST RECENT occurrence section, then ask the set, INTERIM VIOLENCE AGAINST VICTIM which follows the MOST RECENT occurrence set. If there has been no violence against victim, or if this will be captured, skip this page when you get to it.

SET 1. FIRST OCCURRENCEA. PHYSICAL VIOLENCE AGAINST VICTIM: FIRST OCCURRENCE

I'D LIKE TO ASK YOU A FEW MORE QUESTIONS ABOUT THE FIRST TIME HE HIT, SLAPPED, OR TRIED TO HURT YOU:

Were you hurt or injured in any of the following ways?:	<u>YES</u>	<u>NO</u>
54. Were you shot with a gun?	1	2
55. Were you cut with a knife?	1	2
56. Were you hit on the head and blacked out?	1	2
57. Did you have any broken bones or teeth?	1	2
58. Were you scratched or bruised?	1	2
59. Did you have any immediate aches or pains?	1	2
