Phase 1 Report

Criminal justice policymakers at all levels of government are hampered by a lack of sound information on the effectiveness of various programs and approaches. To help remedy the problem, the National Institute sponsors a National Evaluation Program to provide practical information on the costs, benefits and limitations of selected criminal justice programs now in use throughout the country.

Each NEP assessment concentrates on a specific "topic area" consisting of groups of on-going projects with similar objectives and strategies. The initial step in the process is a "Phase I" study that identifies the key issues, assesses what is currently known about them, and develops methods for more intensive evaluation at both the national and local level. Phase I studies are not meant to be definitive evaluations; rather, they analyze what we presently know and what is still uncertain or unknown. They offer a sound basis for planning further evaluation and research.

Although Phase I studies are generally short-term (approximately six to eight months), they examine many projects and collect and analyze a great deal of information. To make this information available to state and local decision-makers and others, the National Institute publishes a summary of the findings of each Phase I study. Microfiche or loan copies of the full report are made available through the National Criminal Justice Reference Service, Evaluation Clearinghouse, P.O. Box 24036, S.W. Post Office, Washington, D.C. 20024.

These Phase I reports are now available:

- . Operation Identification Projects
- . Citizen Crime Reporting Projects
- . Specialized Police Patrol Operations
- . Neighborhood Team Policing
- . Pre-Trial Screening
- . Pre-Trial Release
- . Treatment Alternatives to Street Crime (TASC)
- . Early Warning Robbery Reduction Projects
- . Delinquency Prevention
- . Alternatives to Incarceration of Juveniles
- . Juvenile Diversion
- . Citizen Patrol
- . Traditional Patrol
- . Security Survey Projects
- . Halfway Houses

ABSTRACT

This report is based on both judgmental and empirical assessments of data related to specialized patrols. It covers a review of relevant literature, evaluation reports, and survey information collected from about 400 law enforcement agencies.

Contained in this report are selected portions of other documents submitted to the National Institute of Law Enforcement and Criminal Justice under the major heading of "Phase I National Evaluation of Selected Patrol Strategies: Specialized Patrol Operations Under the National Evaluation Program."

This report describes general uses and effects of specialized patrols and common assumptions underlying their existence. It is focused on the findings from a sample of projects selected as being representative of the state of knowledge on specialized patrols. The assessment of this sample includes information on success and failure as related to performance and effectiveness.

More research is needed before a definitive, final word can be written on the use of specialized patrols. The exact methods and uses of specialized patrols varied from location to location and the existing research and evaluation information on performance is of questionable accuracy and reliability. The various sources of formal and informal information that were collected have been systematically analyzed and displayed for each project under study. This permits the reader to examine both evaluation information and the present weight of informed police opinion on important issues such as arrest performance, deterrence in terms of increases and decreases in crime, the amount of change in arrests and deterrence effected by a unit, and the impact of a specialized patrol on the community it serves. Indicators are also developed and displayed about the collective performance and effectiveness of three general types of specialized patrols: Low Visibility, High Visibility, and Combined High/Low Visibility projects.

FOREWORD

Specialized crime patrols are commonplace in police departments throughout the country, yet little is known about their impact on crime. Drawing from studies of 22 specialized patrol programs throughout the country, this study examined three different approaches to specialized patrol: "low visibility" programs, which use plain-clothes officers and mechanical devices to increase arrests and thereby reduce crime; "high visibility" units, which assume that the presence of uniformed officers is in itself an effective deterrent; and "high/low visibility" patrols, which use a combination of these tactics both to deter crime and to increase apprehension rates.

The findings of this study are limited, but they do suggest that certain types of specialized patrol offer a promising alternative to conventional undirected patrol.

Gerald M. Caplan
Director
National Institute of Law
Enforcement and Criminal Justice

PREFACE

What is known about specialized patrols in the United States? What types of specialized patrols are relied on most by law enforcement agencies? Which type of specialized patrol is most effective in combatting a given type of crime?

These are some of the many questions which the Institute for Human Resources Research (IHRR) attempted to answer for the National Institute of Law Enforcement and Criminal Justice (NILECJ), Law Enforcement Assistance Administration (LEAA).

This report summarizes what was both a judgmental and an empirical assessment of information on specialized patrols. It is a condensation of four separate reports bearing the major heading of "Phase I National Evaluation of Selected Patrol Strategies: Specialized Patrol Operations Under the National Evaluation Program." The separate documents upon which this report is based can be obtained from the NILECJ. They are listed below, together with a brief description of each:

Product 1: Literature Search--This entailed a review of thousands of grant applications submitted to LEAA and other Federal agencies, many books and journal articles of both domestic and foreign origin and various evaluations of specialized patrol operations. The final product represents about 600 literature items relevant to specialization, the impact of specialized patrols on the community, and evaluation of specialized patrols.¹

Product 2: The Universe and Selected Project Descriptions--This report presents estimates of the universe of specialized patrols by type of law enforcement agency as determined by mail and telephone survey. Most of the report is devoted to a systematic, descriptive analysis of 21 patrol projects which were purposively selected as being representative of what is known about the most widely used forms of specialized patrol; that is, civilian dress, uniformed tactical, and mechanical device tactics.²

Product 3: Project Families, Synthesis Framework and Measurement--This report synthesizes the selected patrols and combined High/Low Visibility patrols. An analytic model is presented, as is a detailed discussion of variables that have been and should be measured in evaluating specialized patrol operations. Various measures are recommended for future evaluations.³

Product 4: Assessment of the Knowledge of Specialized Patrol--This report is designed to determine data reliability, assess success and failure, amass a knowledge base, and identify major gaps in the knowledge on specialized patrols.⁴

Each of these tasks was undertaken by a team of persons experienced in both law enforcement and evaluation research. An ultimate purpose of the project was to determine the state of knowledge on specialized patrols and to identify gaps that should be targeted for future research.

The bulk of this report (Chapters II through IV) primarily reflects the work presented in Product 4. However, in order to understand how Product 4 was developed, it seems useful to summarize some of the information presented in the first three reports. These summaries are the focal point of Chapter I.

Before presenting this summary information, the authors would like to acknowledge the assistance of Dr. Richard Barnes, Mr. David Farmer, and Ms. Kay Monte of the National Institute of Law Enforcement and Criminal Justice. We wish to thank also the following members of the project Advisory Board:

- . Sheriff Michael Canlis
- . Mr. Joseph Lewis
- . Dr. Elinor Ostrom
- . Chief James Parsons
- . Chief Rocky Pomerance
- . Mr. John Stead
- . Dr. Victor Strecher
- . Mr. Eugene Zoglic

Finally, thanks are extended to the numerous law enforcement personnel across the nation who furnished information and materials on specialized patrols. These include many members of police departments, sheriff departments, county police, state police, and personnel in State Planning Agencies. Without their assistance, this study could not have been completed.

SUMMARY

This report on specialized patrols is based on a review of relevant literature; a field survey designed to collect information from about 400 law enforcement agencies; and a judgmental and empirical assessment of a sample of projects selected as being representative of the knowledge on civilian dress, uniformed tactical, and mechanical device specialized patrol tactics.

This report covers selected portions from a series of studies bearing the major title of "Phase I National Evaluation of Selected Patrol Strategies: Specialized Patrol Under the National Evaluation Program." It represents an effort by the Institute for Human Resources Research to assist the National Institute of Law Enforcement and Criminal Justice in its coordinated information-gathering on law enforcement in the United States.

This study found that some form of specialized patrol is used by three fourths of the police departments serving cities with populations of 50,000 or more persons. A small percentage of departmental units in smaller cities, sheriffs, state police, and county police also rely on specialized tactics.

The tactics most frequently used--civilian dress, uniformed tactical, and mechanical devices--were found to fall into three different types of families, largely because of certain assumptions regarding the efficacy of low versus high police visibility. The Low Visibility family is based partly on the assumption that invisible police presence, achieved through civilian dress and/or mechanical device tactics, will increase arrests and, therefore, reduce crime. High Visibility patrols are based, in part, on the assumption that increased uniformed police presence, achieved through a uniformed tactic, will deter crime and also increase the likelihood of arrest. High/Low Visibility patrols represent a multifaceted approach, one which combines high and low visibility strategies and utilizes uniformed tactical and civilian dress and/or mechanical device tactics. These patrols are expected to deter crime and increase arrests. Other objectives common to all families are to increase convictions, clearances, and citizen support and involvement and to maintain citizen safety and respect.

In the field, short-term evaluations based on inadequate study designs have left basic assumptions untested and have yielded noncomparable results gleaned from a diverse variety of measures. Nevertheless, available information has been assessed and systematically arranged so that the reader can examine the weight of present evidence, including informed opinion of law enforcement personnel.

Gross ratings on success and failure related to performance and effectiveness yielded a set of tentative conclusions:

- . High Visibility patrols are more successful at deterrence than apprehension
- . High/Low Visibility patrols are slightly more successful at apprehension than deterrence
- . Although no conclusive statement can be made about the Low Visibility family, due to inadequate information, existing data

suggest the projects in this family were slightly more successful in deterring crime than in increasing arrests

These tentative conclusions do not provide answers to several questions critical to administrators:

- . Is specialized patrol more cost-effective than traditional patrol in a given crime situation?
- . Which specialized tactic is most effective for combatting a given type of crime?

Standard procedures need to be devised and used for amassing information at the local and national levels. Such information could provide answers to these crucial questions. The results should be disseminated to regional, state, and local law enforcement personnel. Rising crime and decreasing financial resources make it even more imperative that cost-effectiveness information be available for planning, allocating, and monitoring law enforcement resources.

I. TYPES, USES, AND EFFECTS OF SPECIALIZATION

Over the years, police departments have relied increasingly on specialized patrols to help combat crime. Specialization, therefore, has become a topic of interest to many law enforcement personnel. They wish to know the advantages and disadvantages of specialization, the extent to which it is relied upon, the effects of different tactics, and so on.

In studying these issues, information was gathered from the literature and from law enforcement personnel via mail, telephone and personal interviews, and questionnaires. An analytic model was then developed to assist in classifying projects into families and in identifying variables that have been and should be measured in evaluating specialized patrol operations. These tasks which provided much of the background information required for the assessment of the state of knowledge on specialized patrols are the subject of this chapter.

A. Literature Review: Excerpts on the Advantages and Disadvantages of Specialization

A major conclusion stemming from the literature review was that there have been too few evaluations of specialized patrols and that those which have been done are often of a quality unacceptable to the research community. Part of the problem lies in the questionable reliability of the most commonly used data base, that is, crime statistics. Since the problems with crime statistics are discussed in a later chapter and a good deal of evaluative data is presented elsewhere, we will limit the summary of the literature here to some advantages and disadvantages which experts in the field have attributed to specialization of police functions.

Whether specialization proves useful or not appears to depend upon the circumstances and needs in a local jurisdiction.

Where specialization is needed, it appears to offer at least five advantages. One is that it leads to specific placement of responsibility for the performance of tasks. Because specialization leads to a clear designation of duties, responsibilities, and objectives, unit commanders can be held accountable for the unit's level of efficiency. Second, specialization also seems to bring about improvements in training, especially since it provides an opportunity for more intensive training than is feasible for the generalist. Third, when a small group is made responsible for a specific task, the group tends to form a cohesive unit which, under proper conditions, can generate further advantages--job satisfaction and good morale. Fourth, because of their definite responsibility and pride in their unit, specialized personnel may develop a proprietary interest in departmental operations that relate to their field; thus, specialization may stimulate interest and participation in the unit's work. Finally, specialized patrols may arouse public interest. Where this interest is positive in nature, it aids in securing necessary support for the department and in enhancing police-community relations.⁵

However, specialization may be implemented unnecessarily or in excess so that it becomes detrimental to the department. It then creates problems of coordination

between the specialists and nonspecialists in the department,⁶ adversely affects morale and job satisfaction⁷ complicates tasks of command,⁸ hampers executive development,⁹ and arouses negative public reactions.¹⁰ It may also lead to "empire building" and to unsuccessful imitation by small departments.¹¹

The relationship between good community relations and effective police work is also a factor that must be considered in weighing the advantages and disadvantages of specialization.¹²

Several specialized patrol practices may have adverse effects on police-community relations. One is the practice of deploying specialized officers to high crime areas for short periods of time. This provides them little chance to become well acquainted with residents and may lead them to develop a detached attitude toward the community.¹³ This detachment may enhance citizen distrust of the police. Another factor that may contribute to this distrust was noted in this survey. This was the practice of locating specialized patrol units at a central headquarters and removing them from areas of frequent patrol.

Much of the negative impact of specialized patrols apparently results from police insensitivity to minority groups. Even with the recent increased emphasis on race relations, surveys indicate that black citizens hold less favorable attitudes toward police than do white citizens.¹⁴

Of course, any police contact with the public can have positive as well as negative aspects. A tactical unit on saturation patrol may simultaneously reduce street crime and transmit the impression of an occupying force. Or, it may increase a community's sense of well-being without a reduction in crime. The deciding factor seems to be how the police are perceived by the community.^{15, 16} The literature does suggest that police review boards, with or without citizen participation, can be useful in assessing the impact of specialized patrols on the community.¹⁷

B. Types and Usage of Specialized Patrols

The literature review, as well as the survey, indicates that three types of specialized patrol tactics are relied upon most frequently by law enforcement personnel: civilian clothes, uniformed tactical, and mechanical devices. Civilian clothes units decrease the visibility of the police and enhance their ability to combat certain forms of crime. This tactic appears to be the most frequently used form of specialized patrol. (See Table I-1.) Uniformed tactical units are also heavily relied upon and concentrate on complementing the work of traditional patrol;¹⁸ they are designed to cope with critical situations and to permit a saturation of police power at a given time or place.¹⁹ In less frequent usage are mechanical devices, such as alarm systems, night vision scopes, and other electronic equipment, which bring sophisticated technology to bear on the problem of crime. These three tactics are the subjects of this report.

As Table I-1 shows, specialized patrol tactics are most likely to be employed by departments serving cities with a population of 50,000 or more persons. In fact, this survey indicates that three fourths of the departments serving these larger communities rely upon one or more types of specialized patrol.

TABLE I-1
THE UNIVERSE OF USAGE OF TACTICS*

Population	Total Cities	National Usage of Tactic**					
		Civilian Dress		Uniformed Tactical		Mechanical Devices	
		Number	Percent	Number	Percent	Number	Percent
Cities Over 50,000 Population	362	171	47%	150	41%	73	20%
Cities Under 50,000 Population	20,000+	2,870	14%	2,494	12%	1,834	9%
Sheriffs	3,120	338	11%	338	11%	184	6%
State Police	50	5	10%	13	26%	7	14%
County Police	66	8	12%	8	12%	5	8%

* The figures are based on statistical estimates derived from nearly 400 jurisdictions. The method was as follows: a randomly selected sample of 647 law enforcement agencies were sent a questionnaire via mail regarding their usage of specialized patrol; 284 responded. A random telephone survey was made of 98 nonrespondents to determine the differences between respondents and nonrespondents. (The latter did report less frequent use of specialized patrols than respondents.) The formulas used to derive the estimates appear in "Product 2 -- The Universe and Selected Project Descriptions."

** Not presented here is a small percentage of other tactics (e.g., canine, bicycle, and horse patrols) which were excluded from this study because of their infrequent usage.

Each of the three tactical types tended to employ certain operational modes: crime-oriented, suspect-oriented, and location-oriented. The crime-oriented mode can be briefly described as special patrol activities designed to impact on specific crimes. The suspect-oriented mode is aimed at apprehension and may involve specific known individuals or groups of likely offenders. This mode often depends upon computerized or manual intelligence data systems to provide information on the habits and locations of suspected or known offenders. The location-oriented mode includes activities targeting upon specific locations or general areas which are considered likely to become centers of criminal activity.

These specialized operations are cited in the literature as effecting increases in arrests and decreases in crimes while also being cost-effective. There are few research findings, however, to substantiate these claims of effectiveness.

C. Selection of a Study Sample

From a survey of evaluation reports, questionnaires, and information gathered from on-site visits to 22 departments with specialized patrols, 21 specialized patrol projects were selected for in-depth study and analysis. This sample was purposively selected because it was believed to be representative of the three types of tactics under study and because it seemed to represent about as much as is known on specialized patrols. Because so little is published and on-site evaluations could not be performed, it seemed necessary to pick many of the sample candidates from among those represented in evaluation reports. Otherwise, there would be little data to assess. The amount of bias introduced into the sample by this selection process cannot be ascertained; however, it is possible that the better planned, better organized, and more successful patrols are those which tend toward an evaluation of their activities. This possibility should be kept in mind by the readers of this report.

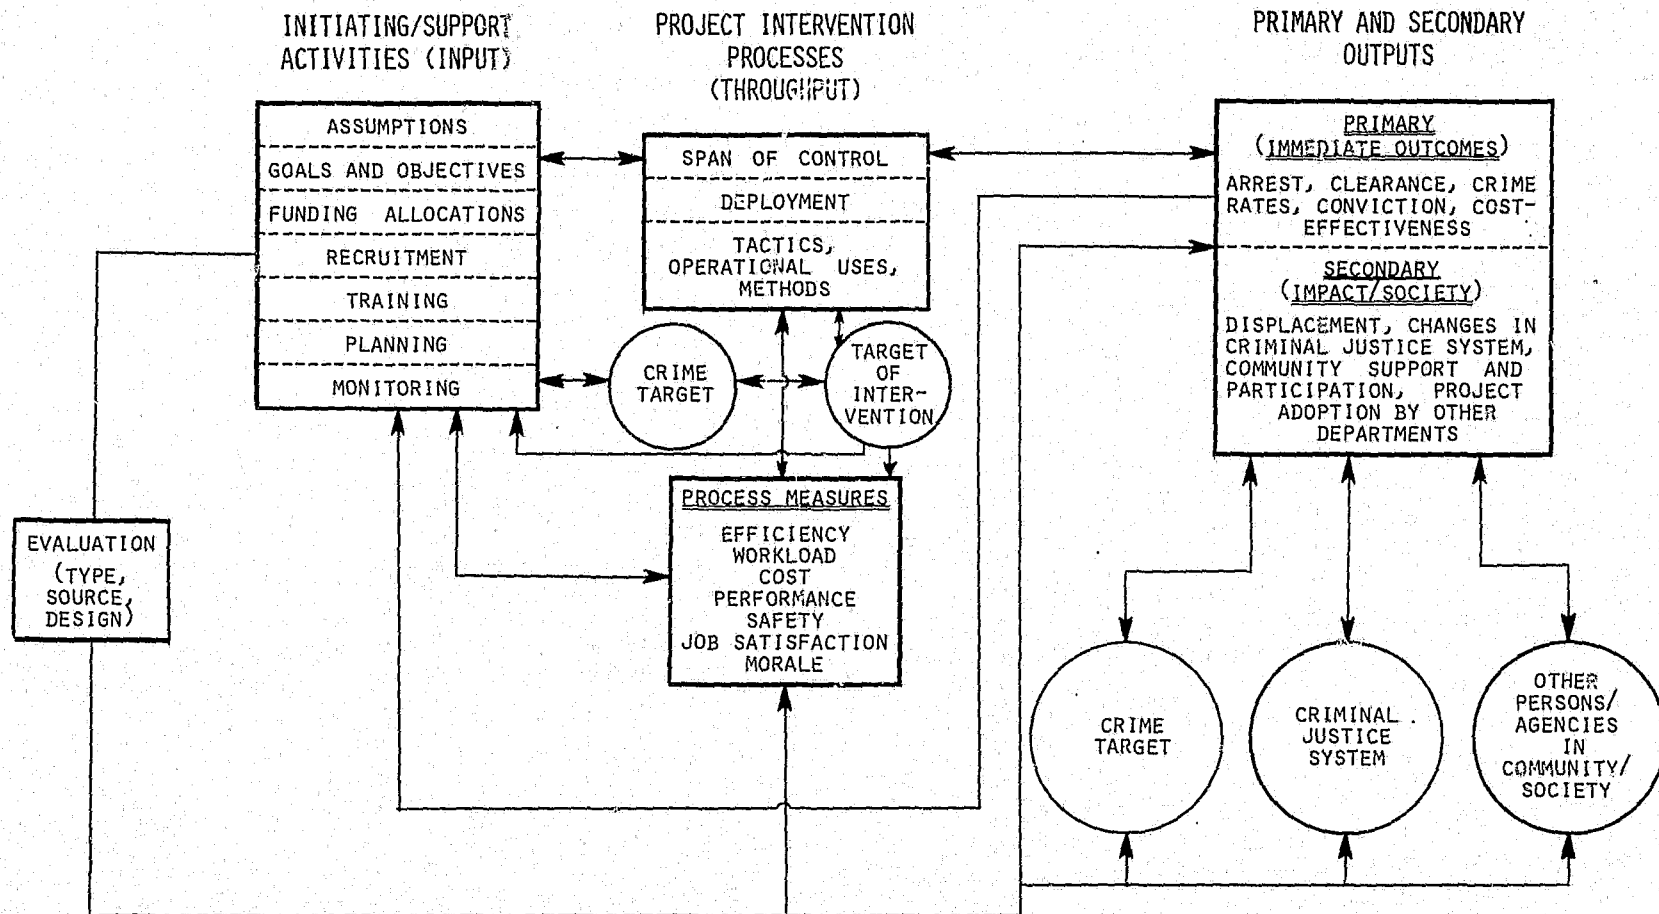

A general systems model was used to analyze each of the 21 projects. This model, shown in Figure I-1, is composed of the following parts:

- . Input. Those initiating and/or ancillary activities or resources deemed useful or necessary to actual project interventions
- . Throughput. Those activities that comprise project interventions (i.e., tactics, operational modes and methods such as surveillance) and the consequences of those interventions on the project and department (process measures)
- . Output. Those results of project interventions expressed in terms of primary outputs (immediate outcomes) such as arrests, clearances and crime reductions, and secondary outputs (impact) such as displacement, arousal of public support, and other effects on the community or broader society

D. Project Families and Measurement

Using the model shown in Figure I-1, three types of specialized patrol families were identified among the sample: Low Visibility patrols, High

FIGURE 1-1
SYSTEMS MODEL

Visibility patrols, and combined High/Low Visibility patrols. Table I-2 shows the types of input and throughput variables used to discriminate the three families. (The output variables did not prove useful in the classification because of the variety of measures used to determine output.)

From Table I-2, one can note that the projects differed essentially only in the assumptions upon which they were based and the tactics they used. On other variables, differences seemed randomly distributed across project types. This leads to the following definitions of project families:

- . Low Visibility patrols. These patrols are based partly on the assumption that less visible police presence, achieved through civilian dress and/or mechanical device tactics, will lead to increases in apprehension and, therefore, to reductions in target crimes.
- . High Visibility patrols. These patrols are based partly on the assumption that increased uniformed police presence, attained through the use of a uniformed tactical tactic, will deter crime and, in turn, increase the chances of apprehending criminals.
- . Combined High/Low Visibility patrols. These patrols are based partly on the assumption that increased uniformed police presence, attained through the use of a uniformed tactical tactic, combined with a low visibility strategy using a civilian dress and/or mechanical unit, will deter crime and increase apprehension rates.

Each family then is expected to increase arrests and deter crimes.

The priority given to these two objectives, however, varies by family type. Among both the High Visibility and High/Low Visibility families, deterrence is the primary objective, increases in arrests is the secondary objective. The opposite ranking of priorities exists among the Low Visibility family; that is, an increase in arrests is the major mission and the achievement of this objective is expected, in turn, to deter crime.

In addition to increasing arrests and decreasing crime, it is also assumed that each family type will:

- . Increase clearances and/or convictions
- . Decrease public fear of crime
- . Maintain public safety
- . Maintain public respect
- . Increase public support of and participation in police activities

As will be noted in later chapters, the variables most often measured are arrests, clearances and/or convictions, and crime reduction. Few studies have addressed the impact of specialized patrols on the community they serve.

TABLE I-2
PROJECT FAMILIES: SIMILARITIES AND DIFFERENCES

CRITERION	LOW VISIBILITY PATROLS (n = 8)	HIGH VISIBILITY PATROLS (n = 5)	HIGH/LOW VISIBILITY PATROLS (n = 8)
BASIC ASSUMPTIONS	INVISIBLE POLICE OMNIPRESENCE WILL LEAD TO APPREHENSION & THUS REDUCE CRIME MOST EFFECTIVELY	VISIBLE POLICE PRESENCE WILL DETER CRIME & MAY LEAD TO INCREASED APPREHENSION	VISIBLE POLICE PRESENCE AND INVISIBLE OMNIPRESENCE WILL MORE EFFECTIVELY DETER CRIME AND INCREASE APPREHENSION
OBJECTIVES	REDUCE CRIME: INCREASE ARRESTS, CLEARANCE, CONVICTION RATES	SAME	SAME

CRIME TARGET	ROBBERY, BURGLARY, OTHER MAJOR CRIMES	SAME	SAME
TARGET OF INTERVENTION	BUSINESS & CITIZENS	SAME	SAME

II. METHODOLOGIES FOR ASSESSING DATA RELIABILITY, PROJECT EFFECTIVENESS AND THE STATE OF KNOWLEDGE ON SPECIALIZED PATROL

The analytic model presented in Chapter I proved useful for analyzing individual projects and for classifying them into families. It was necessary, however, to develop additional methodologies, consistent with the analytic model, which would permit assessment of the reliability of informational sources and to interrelate these with techniques designed to assess project effectiveness and the state of knowledge on specialized patrol. This chapter provides summary descriptions of these various assessment methods; more detailed descriptions of the methodologies appear in the Product 4 report.

A. Assessment of Information Sources

To determine the accuracy and reliability of available data, it was necessary to assess three major sources of information: evaluation reports, unevaluated crime figures, and expert opinion (i.e., judgments of police personnel). In each case, three reliability ratings were applied: low, medium, and high.

1. Evaluations. Evaluations were rated on several dimensions: the use of multiple measures; the relevancy of the measures; the testing of hypotheses (assumptions); the accuracy of the data base; the adequacy of the statistical tests; controls for variables considered in research as crucial to internal validity (history, maturation, testing, instrumentation, statistical regression, selection biases, experimental mortality, selection-maturation interaction); and controls for experimental external validity criteria (reactive or interactive effects of testing, interaction effects of selection biases and the experimental variable, the reactive effects of experimental arrangements, and multiple-treatment interferences). Table II-1 presents the criteria for assigning a particular rating to each type of evaluative dimension.

However, it should be noted that the evaluation reports seldom provide a detailed description of the methodologies employed. This deficiency greatly hampered a systematic evaluation of the projects. Further, the projects were seldom based on any rigorous experimental design so that criteria related to experimental internal and external validity were used mainly as standards by which we could assess evaluations.

2. Crime figures and other raw data. Unevaluated crime statistics were available for a number of projects. These pertained mostly to arrest, clearance, conviction, and crime increase/decrease data. Unfortunately, these data were in many different forms, such as rates, percentages, raw numbers, and averages; seldom was there any accompanying information to convert these figures into a standard form. All forms of crime figures were considered suspect in terms of reliability. The problems inherent in crime statistics are discussed more fully in the Product 1 report.

The literature can be summarized here by saying that the crime rate is almost certain to be an underestimate of crime since it is based on reported rather than actual crimes; it may also be affected by many societal factors unrelated to police activity (e.g., economic factors such as high unemployment rates, increased or decreased willingness of victims to report crime in any given time period).²⁰ Arrest rates are also beset with problems regardless of

TABLE II-1
CRITERIA FOR SCALING EVALUATION DATA

Dimension Rated	Scaling Criteria
Number of Measures	<p><u>Low</u>: one measure</p> <p><u>Medium</u>: one or two measures based on crime, arrest, conviction and/or clearance rates and one measure of community impact (e.g., community attitudes, data from courts) or process impact (e.g., morale)</p> <p><u>High</u>: multiple measures of primary outputs (e.g., arrest, clearance, conviction, or crime rates) and two or more measures of impact on community and/or patrol or department</p>
Relevancy of Measures	<p><u>Low</u>: not related to hypotheses and objectives</p> <p><u>Medium</u>: incompletely related to hypotheses and objectives</p> <p><u>High</u>: adequate to test hypotheses and objectives</p>
Adequacy of Design in Terms of Internal/External Validity (Experimental Criteria Only)	<p><u>Low</u>: violates all or 1/4 of internal/external validity criteria relevant to project</p> <p><u>Medium</u>: controls for 1/4 - 1/2 of any internal/external validity criteria related to project</p> <p><u>High</u>: controls for over 1/2 of any internal/external validity factors relevant to project</p>
Accuracy of Data Base	<p><u>Low</u>: cannot be ascertained or is based on analysis or records of police department only</p> <p><u>Medium</u>: based on department crime figures and one or two outside sources; or evaluator's statement that the department's figures are of better-than-average quality</p> <p><u>High</u>: police figures checked against three or more outside data sources</p>
Appropriateness of Statistical Tests	<p><u>Low</u>: tests either too simple or too sophisticated (or inadequate) for data base</p> <p><u>Medium</u>: tests are adequate but incomplete in scope</p> <p><u>High</u>: tests are both adequate and comprehensive</p>
Tests Hypotheses	<p><u>Low</u>: fails to test or inadequately tests hypotheses (assumptions)</p> <p><u>Medium</u>: fails to test all hypotheses or tests part of the hypotheses inadequately</p> <p><u>High</u>: tests all hypotheses adequately</p>
Tests Objectives	<p><u>Low</u>: fails to test objectives or tests 1/4 of the objectives inadequately</p> <p><u>Medium</u>: tests from 1/4 - 1/2 of objectives adequately</p> <p><u>High</u>: tests 1/2 or more of the objectives adequately</p>

the method used to derive an arrest rate.²¹ For example, the most frequently used arrest rate (the ratio of arrests to reported offenses) is subject to manipulation by police when they feel compelled to react to political pressures. It also is subject to possible unreliable reporting. Clearance rates (i.e., the ratio of crimes solved by type to the total number of reported crimes) are subject to the same problems as arrest rates and, in addition, are influenced by parts of the criminal justice system outside the police department, such as plea bargaining and other procedures.^{22,23} Similar problems arise with the use of conviction rates as performance or effectiveness measures. In short, the reliability of crime figures is questionable. The extent to which the figures are inaccurate or unreliable seems undetermined. Since the bulk of available information (including evaluations), rests on these types of data, the assessment of the knowledge on specialized patrol rests on a shaky foundation.

For the reasons stated above, a low reliability rating was given to police department crime figures. The rating rose to medium when a evaluator rated the department's data base as being of better-than-average quality. Where a department's figures were consistent with those of an outside source (e.g., victimization surveys), these data received a high reliability rating. Un-evaluated data on citizen support, complaints, and participation were also considered. These data were simply reviewed in relation to any positive or negative impact they might have had on the patrols and were not included in any rating system.

3. Expert opinion. The data base included many statements from police personnel at various departmental levels regarding the effectiveness of their specialized patrol units. These judgments encompassed many types of information, such as crime statistics, observations of patrol personnel, informal conversations with citizens, and interrelationships between the department and other parts of the criminal justice system.

In assessing this information, a low reliability rating was given if the expert merely expressed an opinion without citing evidence or if the opinion was based only on one or two crime statistics. As departmental personnel cited more and more evidence (e.g., records of morale, safety of patrolmen, citizen complaints), the rating rose, according to specified criteria, to one of medium or high reliability. As in the case of evaluation data, reliability ratings rose whenever a statement was supported by two or more independent types of evidence.²⁴

However, because there was no way of verifying expert opinion and because it represented information reported by persons with a stake in the subject matter, it was considered less reliable than other informational sources. Where police personnel provided raw data, such as crime statistics, these data were selected as a basis for rating project success or failure on a given dimension and the information was placed in the category of crime figures.

B. Assessment of Project Success and Failure

The reliability ratings of the informational sources were used to assist in devising a scale of success and failure which could be used to rate projects on specified dimensions and in gross, overall terms.

1. Variables of interest. In assessing success and failure, three types of variables were of interest:

- . Independent variables--Those activities of specialized patrol that are allowed to vary while other factors are held constant. Examples of independent variables are the tactics, operational modes, and such methods as decoy and stakeout.
- . Dependent variables-- Those factors that are expected to change as a result of the independent variables. Dependent variables under consideration included the primary and secondary outputs shown in Figure I-1 (e.g., arrest rates, crime reduction, job satisfaction, citizen support).
- . Intervening variables-- Processes that intervene between the independent and dependent variables. The major intervening variables under consideration appear in Table II-2.

2. Variables measured and rated. Not all variables of interest have been measured by evaluators. This limited the number and types of variables that could be rated in this study. The variables most often considered by evaluators were four primary outputs--arrests, convictions, clearances, and crime reduction. Less attention has been given by evaluators to displacement of crime; citizen attitudes (secondary outputs); and to process measures such as performance, efficiency, cost-effectiveness, safety, and morale.

3. Assessing performance and effectiveness. One assigned task was to determine the range of performance and effectiveness among and across specialized patrol families. This proved impossible for the following reasons:

- . The data were not comparable across projects due to the lack of standardized measures
- . Serious flaws in the evaluation designs hindered any definitive conclusions. The most serious flaws were:
 - . Failure to use an adequate comparison group
 - . Failure to control for historical changes in project operations
 - . Failure to account for the effects of units other than the specialized patrol on target crimes
 - . Inadequate study of displacement

Given these problems, the question arose as to how tentative conclusions could be drawn regarding the performance and effectiveness of the patrols under study. The solution to this dilemma was tied to the criteria and ratings for success and failure.

4. Assessing success and failure. A success scale was devised which was composed of three ratings: Success, Probable Success, and Qualified Success. The first rating represents the highest level of success; it indicates a rather high level of performance and/or effectiveness as confirmed by an informational source rated rather high in reliability. The Probable Success and Qualified Success ratings, respectively, represent decreasing levels of

TABLE II-2

INTERVENING VARIABLES AFFECTING SPECIALIZED PATROLS

Under Department Control	Not Under Department Control

Cooperation Between Patrol & Other PD Units	
Evaluation	

performance and/or effectiveness and/or decreasing levels of informational reliability. The failure scale was devised in the same manner and consists of three ratings: Failure, Probable Failure, and Qualified Failure. An Unknown category was applied whenever there were no data or where data were uninterpretable because of insufficient information.

Attempts to base the rating procedures on established standards (e.g., quantitative rates) were considered but proved inappropriate and invalid, especially in light of the poor quality of the data base. Nor could one consider for rating only those projects whose evaluations were rated medium to high on experimental internal and external validity factors since this criterion would have left few projects to rate. Further, there were systems considerations which fit poorly with stringent evaluation criteria. For example, the Houston S.W.A.T. team did not have a particularly outstanding arrest rate and its budget was extremely high. Using evaluation criteria alone, this unit would probably be rated a failure on some dimensions. Yet a site visit and other data indicated that this unit was considered important to the department. It was established to handle a very specific and difficult task--barricade and hostage cases. Since these cases occurred infrequently, the unit spent much of its time supplementing the work of other units--work that could have been done by less specialized personnel. Hence, its arrest performance was not outstanding. The needs of the department and the objectives of the unit tempered the ratings so that a Qualified Success rather than a Failure rating on a specific activity was generally applied.

The Houston case illustrates how evaluation conclusions could be at odds with the realities and, perhaps, political considerations faced by police departments. Police departments are answerable to the public and under the scrutiny of public officials. Citizen demands are part of the considerations departments must face. Thus, it was felt that success or failure could not be defined solely in terms of an evaluators' determination of some aspect of performance and effectiveness. It was felt, however, that critical resource allocations should rest on sound evaluations as well as considerations relating to public welfare and political issues. All these issues were taken into account in the ratings.

Several methods were used to judge success and failure. These are described briefly below.

a. Assessment of expert opinion. Success/Failure ratings using expert opinion data were highly related to the reliability ratings given to this informational source. A Success rating was given whenever expert opinion was rated high on reliability criteria. Probable Success applied whenever this source received a medium reliability rating. A low rating on reliability led to a Qualified Success rating. The criteria for Failure ratings were the same as those for Success ratings.

b. Attainment of objectives. This measure was considered a questionable indicator of success or failure despite the fact that evaluators encourage projects to set specific objectives that can be cast in quantifiable and measurable terms. While it is true that objectives framed in quantifiable terms can simplify measurement and the interpretation of findings, the practice can also load the results. For example, the attainment of a 5 percent reduction in the target crime would meet the objective of a 5 percent reduction in the crime.

The attainment of a 4.9 percent reduction in the target crime would not meet the objective. To call such a project a failure, obviously, would be ludicrous. Further, some objectives may be unrealistic (e.g., a 60 percent increase in convictions) if the resources allocated to the project are insufficient for attaining a stated objective or the objective attainment is not completely under the control of the project. Or, consider still another case. A project's target area shows an increase in a target crime when the objective has been to reduce the target crime. By the criterion of objectives attainment, this project is clearly a failure. Yet, how does one judge it when its target area shows only a slight crime increase and adjoining areas show a high increase and there is no evidence that the specialized patrol has displaced crime to these areas? To rate this last case a total failure seems unjust and unrealistic.

Such examples should suffice to illustrate the stated objections to using objectives attainment as a sole criterion for judging the success or failure of a project. However, ratings of objectives attainment were made. A Success rating applied whenever these data were based on a comparatively adequate evaluation and/or were supported by field data. A Probable Success rating applied if the evaluation was considered only fairly adequate and/or the raw data were unsupported by field data or an evaluation. A Qualified Success rating was given if the data were contradictory (e.g., if different results were obtained from different evaluators). Failure ratings were based on the same criteria.

c. Amount of change. The amount of change effected by a patrol on a specific activity was considered a more relevant measure of success or failure. Using this measure, one does not simply ask: Did the project reduce crime and attain its stated objective? Rather, one asks: To what extent was crime reduced? The criteria for these success ratings appear in Table II-3; those for failure ratings appear in Table II-4.

d. Performance and effectiveness indicator ratings. Ratings were also given to individual activities. These included process measures (efficiency, cost-effectiveness) and primary outputs (arrests, clearance, conviction, crime reduction). Table II-5 presents the criteria for rating these individual activities in terms of success or failure.

e. Overall ratings. The above indicators of success and failure were applied to each project within a family. The ratings also were used in an additive fashion to provide some overall ratings of each family type. That is, all Success and Failure ratings for a given activity were added together in order to show the percentage of Success, Failure, and Unknown ratings among and between families. In addition, another overall rating was used which permitted a gross assessment of each type as Success, Probable Success, or Qualified Success. These overall ratings (like all the ratings) should be viewed with caution because of the questionable data base and the limited comprehensiveness of some evaluation measures.

C. Amassing a Tentative Knowledge Base and Identifying Gaps

From the various tasks undertaken in this study, it was apparent that available information would not yield a definitive, final statement on specialized patrols. The data were not only too sparse but also of questionable reliability, problems that will be elaborated upon more fully in Chapter IV. Two possibilities

TABLE II-3

SUCCESS RATINGS: AMOUNT OF CHANGE

<u>Rating</u>	<u>Criteria</u>
S = Success	1. Amount of change is statistically significant in the desired direction
PS = Probable Success	1. Amount of change appears high; no statistical tests have been performed 2. Amount of change is high and statistically significant but data include combined output of specialized patrol and nonspecialized patrol
QS = Qualified Success	1. Amount of change is fairly low; no statistical tests have been performed 2. Two or more evaluations draw different conclusions from same data/project (e.g., one shows positive change, one negative or no change); rating is based on most adequate evaluation(s) 3. Change not in the desired direction, but performance/outcome higher than that for nontarget area and/or nonspecialized patrol
U = Unknown	1. No data; data uninterpretable because of inadequate comparison criteria

TABLE II-4

FAILURE RATINGS: AMOUNT OF CHANGE

F = Failure

1. Amount of change is not statistically significant in the desired direction; adequate test
2. Amount of change not in desired direction and performance/outcome poorer than nontarget areas/nontarget specialized patrol; no statistical tests performed

PF = Probable Failure

1. Amount of change is not statistically significant; not very adequate test

QF = Qualified Failure

1. Project performance/outcome appears to remain almost constant (i.e., only slight change in either direction); no statistical tests performed; rating based on most adequate evaluation(s) where results conflict

U = Unknown

1. No data; data uninterpretable because of inadequate comparison criteria

TABLE II-5

SUCCESS/FAILURE RATINGS: INDIVIDUAL ACTIVITIES--
PERFORMANCE AND EFFECTIVENESS

<u>Rating</u>	<u>Criterion</u>
S = Success F = Failure	<ol style="list-style-type: none"> 1. Based on comparatively adequate evaluation 2. Based on adequate raw data supported by IHRR interview data and/or evaluation
PS = Probable Success PF = Probable Failure	<ol style="list-style-type: none"> 1. Based on only fairly adequate evaluation 2. Based on adequate raw data; unsupported by IHRR interviews and/or evaluation
QS = Qualified Success QF = Qualified Failure	<ol style="list-style-type: none"> 1. Project performance/outcome on one dimension not consistent across information sources, rating is based on most reliable information; or measures contradicted by other data (e.g., project shows crime reduction but probable displacement)
U = Unknown	<ol style="list-style-type: none"> 1. No data; data uninterpretable because of inadequate comparison criteria

existed: (1) to bypass any conclusionary statements and concentrate only on delineating important deficiencies in the knowledge base or (2) to establish some criteria for inclusion and exclusion of material from a tentative set of conclusions. The latter course was chosen in the belief that a tentative knowledge base could be useful to law enforcement personnel.

The criteria for including and excluding descriptive and analytic data from a tentative knowledge base were: consistency (i.e., characteristics that appeared frequently in the data); crucial differences between project families; and important relationships between different success and failure indicators. To identify crucial gaps in the knowledge base, data related to each variable in the systems model (Figure I-1) were scrutinized, together with important intervening variables (Table II-2) that might affect specialized patrol operations. In judging the relative importance of all gaps, each gap was viewed in terms of its relevance to the testing of the assumptions underlying the existence of each patrol family. Crucial study design problems and other factors were identified also in order to pinpoint the reasons for major gaps in knowledge.

III. ASSESSMENT OF PROJECT FAMILIES

The methodologies described in Chapter II were used to assess and compare the three project families. This assessment is summarized in this chapter in four different sections:

- . Part 1--Low Visibility Patrols
- . Part 2--High Visibility Patrols
- . Part 3--Combined High/Low Visibility Patrols
- . Part 4--Comparison of Project Families

The projects under study are listed by name and location in the first three sections and identified in the accompanying tabular data by their location.

Part 1

Low Visibility Patrols

The eight patrols selected for study in the Low Visibility family are:

- . Street Crime Unit, New York, New York
- . City-Wide Anti-Crime Unit, Boston, Massachusetts
- . Tactical Operations Unit, Nashville, Tennessee
- . Old Clothes Unit, Memphis, Tennessee
- . Vehicle Theft Crime Specific Abatement Project, San Francisco, California
- . High Incidence Target (HIT) Project, Henrico County, Virginia
- . Strategic Target Oriented Project, Miami, Florida
- . Tact II Alarm System Program, Birmingham, Alabama

Seven of these patrols rely heavily on a civilian dress tactic (one also uses mechanical devices) and one is basically a mechanical devices unit backed by traditional patrol.

A. The Knowledge Base: Accuracy and Reliability

Of the eight Low Visibility patrols, only those in New York, San Francisco, and Henrico County had been formally evaluated. Crime figures were provided by three other departments (Boston, Miami, and Birmingham) and expert opinion data by all but the Henrico County project. This combined knowledge base cannot be considered highly accurate or reliable, as indicated by the reliability ratings presented in Table III-1.

TABLE III-1

LOW VISIBILITY PATROLS:
RELIABILITY RATINGS OF INFORMATIONAL SOURCES

CRITERION	RELIABILITY RATING	NUMBER OF PROJECTS
EVALUATIONS		
Number of Measures	Medium	3
Relevancy of Measures	Medium	3
Adequacy of Design: Internal Validity (experimental criteria)	Low	3
Adequacy of Design: External Validity (experimental criteria)	Low	3
Accuracy of Data Base	Low	2
	Medium	1
Appropriateness of Statistical Tests	Low	2
	Medium	1
Tests Hypotheses (assumptions)	Low	3
Measures Objectives	High	2
	Low	1
CRIME FIGURES	Low	3
EXPERT OPINION	Low	1
	Medium	2
	High	4

Further, only 43 percent of the objectives set for these projects had been even roughly assessed, despite the fact that most objectives were cast in measureable form (see Table III-1). Nor was there any real test of the assumptions upon which the Low Visibility Patrols are based.

B. Ratings of Success and Failure

The following subsections summarize the tentative assessment of the success and failure of the Low Visibility projects on selected measures. Numerical and descriptive data, as well as the ratings of these data, are included.

1. Attainment of objectives. Table III-2 shows the types of objectives set by the Low Visibility projects and the number of objectives attained. Considering only the ratings of evaluations/crime figures, these patrols failed to attain 14 percent of their objectives and succeeded in attaining one third; however, over half of the success ratings fell within the Probable

TABLE III-2

LOW VISIBILITY PATROLS:
ATTAINMENT OF OBJECTIVES

PROJECT	OBJECTIVE	MET	UNMET	UNKNOWN	RATING
NEW YORK	QUALITY ARREST	EVAL.			S
	PUBLIC SAFETY			X	U
	PUBLIC RESPECT	CF			QS
BOSTON	QUALITY ARREST	CF			PS
	CRIME REDUCTION	EO			(S)
	60% CONVICTION RATE	CF			PS

MIAMI	REDUCE ROBBERIES 1.5%	EO			(S)
	INCREASE ARRESTS 2.5%	EO			(S)
	INCREASE CONVICTIONS 5.0%	EO			(S)
BIRMINGHAM	INCREASE ROBBERY ARRESTS	CF			S
	INCREASE CONVICTION RATE	EO			(S)
	PUBLIC SAFETY	EO			(S)

KEY: EVAL. = Evaluation data

EO = Expert opinion

CF = Crime figures (and other raw data)

"Expert Opinion" ratings appear in parentheses.

*

Data of questionable validity.

Success (PS) and Qualified Success (QS) range. Looking only at expert opinion ratings, these patrols achieved 43 percent of their stated objectives with no reported failures. (One half or more of all types of ratings fell into the Unknown category.)

2. Amount of change. A more stringent criterion of effectiveness is the amount of change effected by the Low Visibility projects. The ratings and the change data upon which they are based appear in Table III-3.

Looking only at evaluation/crime figure ratings, two projects were somewhat successful in reducing crime while one was not. Two were successful also in increasing arrests, and one was a failure. The addition of expert opinion accounts for 50 percent of the ratings shown in Table III-3. All experts cite positive results although three ratings fall into the Probable Success category because of a medium reliability rating of the expert opinion data.

Given so few hard data, no conclusive statements can be made about the ability of the Low Visibility projects to effect change. It is worth noting, however, that police personnel appear convinced that their patrols are effective change agents.

3. Efficiency, cost-effectiveness, and safety. The available data on the efficiency, cost-effectiveness, and safety of the Low Visibility projects appear in Table III-4. These data are rather incomplete and many of the measures are not very comprehensive. The best data come from the New York City project which appears to be efficient, safe, and probably cost-effective. The data also suggest that the San Francisco project may be cost-effective. The Henrico County project, on the other hand, appears rather costly; its mechanical device tactic appears especially nonproductive and costly. The two expert opinion ratings suggest that the Low Visibility tactics of Birmingham and Boston contributed to the safety of the projects' personnel.

4. Performance and effectiveness. The data in this subsection can often be classified as both process and primary output measures, in keeping with the systems model (Figure I-1). The data have not been so separated (i.e., into process vs primary output) in order to avoid repeating the same information in different sections. Again, numerical and descriptive material are presented with the ratings.

a. Arrest performance and effectiveness. The available data on arrest performance and effectiveness shown in Table III-5 suggest that two projects (Henrico County and San Francisco) were failures in this area. All other projects received at least a Probable Success rating though two ratings rest on expert opinion. The New York and Birmingham projects appear especially successful in effecting arrests of target criminals.

b. Clearance and conviction performance and effectiveness. Information on clearances and convictions is quite sparse. As shown in Table III-6, the majority of ratings on each of these measures falls into the Unknown category. However, only one Failure rating appears (for Henrico County). The New York City project, and the Boston project modeled after it, appear especially successful in effecting a high conviction rate.

TABLE III-3

LOW VISIBILITY PATROLS:
SUCCESS AND FAILURE RATINGS ON AMOUNT OF CHANGE

PROJECT	TYPE/SOURCE	LOW VISIBILITY PATROL	COMPARISON/CRITERIA	RATING

TABLE III-5

LOW VISIBILITY PATROLS: ARREST PERFORMANCE AND EFFECTIVENESS

PROJECT	TYPE/SOURCE	LVP	COMPARISON/CRITERIA	RATING
New York City	Increases: Evaluation	Overall arrests up 52%; grand larceny arrests up 1600%; robbery arrests up 11%	Compared to crime figures the year before LVP	S
Boston	Average number per month: Crime Figures (largely robbery & larceny)	Average 142 per month		PS
Nashville	Increase: Expert Opinion	LVP personnel make more arrests than traditional patrolmen		(PS)
Memphis	Increase: Expert Opinion	Arrests have increased with use of LVP		(PS)
San Francisco	Increase: Evaluation	"Very slight increase"	Compared to year before LVP	PF
Henrico Co.	Average felony arrests per officer: Evaluation	3.6 felony arrests per man over a 7-month period		F
Miami	Rate: Crime Figures	22% arrest rate (arrests/offenses)		PS
Birmingham	Number: Crime Figures	8 "in progress" robbery arrests in two months	No "in progress" arrests in nontarget areas	S

NOTE: Ratings of expert opinion appear in parentheses.

TABLE III-6

LOW VISIBILITY PATROLS: CLEARANCE AND CONVICTION PERFORMANCE/EFFECTIVENESS

PROJECT	TYPE/SOURCE	LVP	COMPARISON/CRITERIA	RATING
	<u>Clearances</u>			
San Francisco	Increase: Evaluation	A "probable" increase	Compared to year before LVP	PS
Henrico Co.	Rate: Evaluation	5.0% robbery clearance rate; 11.0% burglary clearance rate	Over 7-month period	F
Miami	Rate: Crime Figures (robberies)	30.4% clearance rate for 3-month period	Over 3-month period	PS
All Others	Unknown			U (n=5)
	<u>Convictions</u>			
New York City	Rate: Evaluation	Overall rate: 88.0% Robbery rate: 76.0% Grand larceny rate: 95.0%	Entire PD, 56% None None	S
Boston	Rate: Crime Figures	Overall rate: 89.0%		S
Nashville	Increase: Expert Opinion	"Usually attain objective of 5% increase"		(PS)
All Others	Unknown			U (n=5)

NOTE: Ratings of expert opinion appear in parentheses.

c. Crime reduction and other activities. Table III-7 presents crime increase/decrease figures for seven Low Visibility patrols; four ratings rest solely on expert opinion. Among these seven projects, only one (Henrico County) appeared to be unsuccessful in reducing target crimes, if one considers the very general statements reported by the experts. Table III-7 also suggests that the San Francisco project was generally successful in other activities such as investigations, saturation sweeps, and diversion of juveniles from the criminal justice system.

5. Comparison of success/failure criteria. Figure III-1 graphically depicts the percentage of combined success, combined failure, and Unknown ratings for the different criteria discussed in the previous sections. The crosshatched portions in various bars represent the percentage of ratings attributable to expert opinion; these are also roughly equivalent to the Unknown ratings for the combined evaluation/crime figures informational sources. What these portions of the graphs actually show, then, is the extent to which the ratings are based on descriptive, unvalidated information.

The evaluation/crime figure data do suggest that one or two Low Visibility projects could be considered failures on all criteria except efficiency and convictions. These are two measures, however, where most ratings fall into the Unknown category.

If one looks at the most complete evaluation/crime figure ratings, the Low Visibility projects appear most successful in arrest effectiveness; about one half received success ratings, and the remaining ratings were equally divided between the Failure and Unknown categories. However, if one includes expert opinion, these projects appear most successful on two other criteria: amount of change and crime reduction.

How successful is another question. Table III-8 shows that the highest percentage of ratings fell into the Probable Success category regardless of the informational source considered. Since these ratings are related to the reliability ratings of the informational sources, it seems possible to conclude that these projects, in general, could be considered Probable Successes. The Henrico County project appeared to be an exception and accounts for a majority of the failure ratings. Our conclusions about the Low Visibility projects, of course, are quite tentative because of the paucity of good evaluative data.

TABLE III-8
LOW VISIBILITY PATROLS:
PERCENTAGE OF DIFFERENT RATINGS ON SELECTED MEASURES

RATING	EVALUATIONS/ CRIME FIGURES	EXPERT OPINION
Success	24%	46%
Probable Success	44%	54%
Qualified Success	4%	--
Failure	12%	--
Probable Failure	16%	--

TABLE III-7

LOW VISIBILITY PATROLS: CRIME REDUCTIONS AND OTHER PERFORMANCE MEASURES

PROJECT	TYPE/SOURCE	LVP	COMPARISON/CRITERIA	RATING
	<u>Crime Reduction</u>			
New York City	In target precincts: Evaluation	Reduction occurred in 27 out of 44 precincts (low confidence level statistically)	Measured over 12-month period	PS
Boston	General: Expert Opinion	"Reduced"		(S)
Nashville	Unknown			U
Memphis	General: Expert Opinion	"Reduced"		(PS)
San Francisco	Percent reduction: Evaluation	Target crime reduced 12.3%	One year before/after LVP	S
Henrico Co	Level of increase: Evaluation	Robbery up 34% in target areas; burglary up 28% in target areas	Increases were higher in nontarget and control areas	PF
Miami	General: Expert Opinion	"Usually met objective of reducing crime"		(S)
Birmingham	In target area: Expert Opinion	"Robbery dropped sharply in target areas"	Increased in non-target areas	(S)
	<u>Other</u>			
San Francisco	Investigations: Evaluation Saturation sweeps: Evaluation Inspection of businesses: Evaluation Recovery of stolen autos: Evaluation Diversion of Juveniles: Evaluation	"Successful" "Successful" "Unsuccessful" "Poor recovery rate" 81 of 94 diversions successful	Before/after project 94 diversions of 531 contacts	PS

NOTE: Ratings of expert opinion appear in parentheses.

FIGURE III-1
SUCCESS AND FAILURE RATINGS: LOW VISIBILITY PATROLS

KEY

6. Community/department impact. Table III-9 shows the data on displacement and community attitudes (secondary outputs).

As can be seen, statistical tests suggested some displacement in two sites, none in another. These, however, were not very adequate tests. For example, displacement in the New York City projects was probably attributable to the presence of a uniformed unit rather than a civilian dress unit under study; the tests did not control for this possibility.

The other available data suggest that the Low Visibility patrols were favorably perceived by their community, that morale was good within the units, and the Low Visibility patrols had no adverse effects upon the morale of the departments.

7. Insights into success and failure. The field data, as well as evaluation reports, suggest that there are several explanations for part of the successes of the Low Visibility patrols. These were: (1) good planning and cooperation with other units (especially in Boston and New York), (2) building strong cases that lead to convictions (Boston, Birmingham, New York), (3) use of exceptional personnel (seven projects), (4) above-average job satisfaction and morale (four projects), (5) significant financial support for the unit (four projects), (6) intensive training (three projects), (7) good use of equipment (Birmingham and New York). Failures, on the other hand, appeared related to low productivity, especially when productivity was compared to costs and/or man hours expended.

Part 2

High Visibility Patrols

The five High Visibility patrols selected for the study were:

- . High Incidence Target (HIT) Project, Alexandria, Virginia
- . Uniformed Anti-Crime Tactical Unit, Dallas, Texas
- . Concentrated Crime Patrol, Cleveland, Ohio
- . Mobile Emergency Response Group, San Jose, California
- . Transit Authority Police Department Patrol Division, New York, New York

A. The Knowledge Base: Accuracy and Reliability

Of these five projects, three were formally evaluated by private firms. Two (those in Dallas and San Jose) were evaluated by their department, though complete documentation of these studies could not be obtained. Although the documentation for these High Visibility projects is more complete than that for the Low Visibility projects, the existing data were not very comprehensive nor were they rated very high in reliability (see Table III-10). However, 64 percent of the objectives set for the High Visibility patrols received some assessment, though the assumptions upon which these projects were based remained essentially untested.

CRIME FIGURES	Low	2
EXPERT OPINION	Low	2

1. Attainment of objectives. Table III-11 shows the 22 objectives of the High Visibility patrols and the number that were and were not met. Obviously, if one judged these projects by this criterion alone, they would generally be judged as failures. Only about 18 percent of the objectives were met while 64 percent were not met (if one includes expert opinion). However, many of the failure ratings applied to one project (Alexandria) which has subsequently undergone changes and reportedly now enjoys a much greater level of success. This apparent picture of failure may be somewhat misleading. Except for the Alexandria project (at the time of the survey), all departments and city officials seemed pleased with these projects.

2. Amount of change. The existing data suggest that three High Visibility patrols effected some positive change over time. As Table III-12 shows, these changes were not always as great as those specified in a project's objectives, nor were the success ratings particularly high. They do suggest, however, some positive changes in crime reduction, arrests, and clearances.

TABLE III-11

HIGH VISIBILITY PATROLS:
ATTAINMENT OF OBJECTIVES

PROJECT	OBJECTIVE	MET	UNMET	UNKNOWN	RATING

	(TOLL BOOTH ROBBERIES)	+0.1%		QS
	(PASSENGER ROBBERIES)	-8.6%*		QS*
	RED. IN FELONY RATE: EVAL	-2/3 DURING HOURS OF SAT. PATROL	INCREASED DURING HOURS OF NORMAL PATROL ONLY	PS

KEY: EVAL = Evaluation
CF = Crime Figures

* Although project performance decreased one year, a "Qualified Success" rating is given because these arrests have increased since the specialized patrol was implemented.

** Problems undefined--data reportedly based on an internal evaluation; IHRR has only some crime figures from this study.

3. Efficiency and cost-effectiveness. Table III-13 presents the few available data on the efficiency and cost-effectiveness of High Visibility patrols; all fall within the Probable Success and Qualified Success categories. The only cost measure available shows a rather high cost per felony deterred (\$35,000); this project received a Qualified Success rather than a Failure rating on this measure only because the Department and City appeared to feel this operation was important for public safety and should be funded.

4. Performance and effectiveness. Again, primary output and process measures are presented together, based on the ratings of available data.

a. Arrest performance and effectiveness. Table III-14 shows the available data on the arrest activity among four High Visibility patrols. The Alexandria project appears again as a Failure; another three as a Probable Success or Qualified Success. The incompatable form in which the data are presented defy any general conclusions regarding performance level.

b. Clearances. Only two projects have any information on clearances: one presents the data in terms of numbers, the other by percentages. Again, we can only give a Probable Success and Qualified Success rating (see Table III-15).

c. Crime reduction and other activity. Some evaluative data are reported for four High Visibility patrols, as shown in Table III-16. The ratings for four projects indicate Qualified Success in crime reduction.

The Other category shown in Table III-16 lists two activities undertaken by the Alexandria project: recovery of stolen property and security checks. The first is rated as a Qualified Success, the latter as a Failure.

5. Comparison of success/failure criteria. Figure III-2 graphically depicts the combined success, combined failure, and Unknown ratings on the various measures under study.

The large percentage of Unknown ratings for amount of change, efficiency, cost-effectiveness, and clearances makes difficult any assessment of these measures. The available data more clearly point to success at deterrence--the prime mission of these patrols--and to a reasonable degree of success at apprehension.

Again, the question: How successful were these projects overall? According to the percentage of ratings for each success and failure category, as shown in Table III-17, the projects appear to be at least a Qualified Success.

KEY

- = EVALUATION & CRIME FIGURES
- = EXPERT OPINION
- = UNKNOWN (NO DATA)

6. Community/department impact. Table III-18 shows the few data available on secondary outputs. Some negative impact is suggested by the displacement phenomenon reported in two sites. Citizen attitudes, on the other hand, appear quite favorable. Not shown are a few findings regarding morale. An evaluation of the Alexandria project (prior to program changes) found that morale was only low to average among the specialized personnel and that coordination was poor between this unit and other units of the Department. The departments in Dallas, New York City, and San Jose were reportedly pleased with their specialized patrols and high-ranking city officials publicly praised the New York and Cleveland projects.

7. Insights into success and failure. The reasons for the success of this group of patrols were partly the same as those cited for the Low Visibility projects: sufficient funding (four projects); selection of high performers (two projects); and reasonably good planning (all projects). Failures, on the other hand, seemed related to the use of volunteer overtime personnel (Alexandria) and, perhaps, the lack of specialized training in most projects.

Part 3

Combined High/Low Visibility Patrols

The eight High/Low Visibility projects selected for study were:

- . Tactical Operations Unit, Greensboro, North Carolina; uniformed tactical (civilian dress)
- . High Incidence Target (HIT) Project, Portsmouth, Virginia; uniformed tactical, mechanical devices
- . Criminal Impact Program, Indianapolis, Indiana; uniformed tactical, (mechanical devices and civilian dress)
- . High Incidence Target (HIT) Project, Virginia Beach, Virginia; uniformed tactical, mechanical devices (civilian dress)
- . Special Weapons and Tactics (SWAT), Houston, Texas; civilian dress, uniformed tactical, mechanical devices
- . Special Crime Attack Team (SCAT), Denver, Colorado; uniformed tactical (civilian dress and mechanical devices)
- . Burglary Abatement Program, San Francisco, California; civilian dress, uniformed tactical
- . Strike Force Operations, Portland, Oregon; civilian dress, uniformed tactical, mechanical devices

Of the projects listed, five rely on all three tactics under study: uniformed tactical, civilian dress, and mechanical devices. Two utilize a uniformed tactical and civilian dress tactic. One relies on a uniformed tactical and a mechanical devices tactic. However, in three cases, the major emphasis is on a uniformed tactical tactic.

TABLE III-18

SAN JOSE	COOPERATIVE EFFORTS: EVALUATION	INTERFACE WITH FEDERAL, STATE & LOCAL PERSONNEL ON BOMBINGS
NEW YORK TAPD	ATTITUDES OF PUBLIC OFFICIALS: EVALUATION	CITY OFFICIALS CONSIDER HVP SUCCESSFUL

A. The Knowledge Base: Accuracy and Reliability

Of the eight High/Low Visibility projects selected for study, only two (Greensboro and Houston) have not been formally evaluated. Among the other six, there have been eight external and two internal evaluations. The Denver project was evaluated by two private firms and by the Department. The San Francisco project also was evaluated both internally and externally. The Portland project provides the only data from a victimization survey; it was evaluated also by the Oregon Law Enforcement Council. Both the Indianapolis and Virginia Beach projects were evaluated by private firms.

Complete documentation of all these studies could not be obtained. Nor did all final reports provide complete details on the methodologies used to evaluate these patrols. These factors compounded the difficulties of assessing the accuracy and reliability of the data.

Nevertheless, the reliability ratings for this group of evaluations was somewhat higher than ratings given to evaluations of other project families, though these evaluations, like most others, did not receive high ratings on the internal and external validity criteria. The other informational sources, as shown in Table III-19, received mostly low reliability ratings.

As in the case of the other patrol families, no real test was made of the assumptions underlying the existence of the High/Low Visibility patrols. However, some assessment was made of three fourths of the objectives set for this group of projects.

B. Ratings of Success and Failure

1. Attainment of objectives. Table III-20 shows the objectives set for the High/Low Visibility projects and the ratings of objectives attainment. Of the 16 objectives, 59 percent were attained, 16 percent were not attained. (An Unknown rating was given in one fourth of the cases.) This is the most successful record of objectives attainment among the project families under study.

2. Amount of change. There were 33 possible measures relevant to the amount of change indicator for the High/Low Visibility projects. These are shown in Table III-21. If one combines the different success and failure ratings (including the one rating of expert opinion), these patrols effected positive change in 18.5 (56 percent) of the areas and failed in only 3.5 (1 percent) of these areas. This group seemed particularly effective in increasing arrests and decreasing crime; the success level for these two areas was 78 percent.

3. Efficiency and cost-effectiveness. Table III-22 presents the available information on efficiency and cost-effectiveness measures for six High/Low Visibility patrols. Some data represent only the conclusions of evaluators; pertinent figures were not supplied.

A majority of the ratings applies to use of personnel, a tactic or a special method (e.g., informant's fund); and all these were rated in one of the success categories. The four failure ratings apply to the use of mechanical devices or costly equipment such as helicopters.

Successful in interdicting operations (terms of efficiency) Efficient Very costly Not uniformly cost-effective Cost-effective; provides more crucial target response Cost-effective for suppressing street crimes		PS PS (QS) (PS) (PS) PS

NOTE: Ratings of expert opinion appear in parentheses.

4. Performance and effectiveness.

a. Arrest performance and effectiveness. Table III-23 presents the available data on the arrest performance and effectiveness of seven High/Low Visibility projects. The assessment yielded no Failure ratings and a high number of Probable Success ratings.

b. Clearance performance and effectiveness. Information on clearances was available on only four projects. As shown in Table III-24, all ratings fell into a success category with the exception of the Portland project which could not be rated because of insufficient data.

c. Convictions and related data. Table III-25 shows information on convictions and related data (e.g., court dispositions) for four of the High/Low Visibility patrols. Here, one Failure rating appears for the Indianapolis project because no statistically significant change occurred in the arrest/conviction ratio after the implementation of the specialized patrol. Two Success ratings appear for the Portland project; statistically significant increases in the number of robbery and burglary cases considered. All other ratings represent a Probable Success.

d. Crime reduction. Table III-26 presents information on crime increases and decreases in seven of eight High/Low Visibility target areas. It shows 12 Success ratings, one Qualified Success rating (representing expert opinion), and one Probable Failure rating. An impressive record by the criteria used in this study.

However, as will be noted in a later section, displacement may have occurred in four areas: Portsmouth, Denver, San Francisco, and Portland. The data are far from conclusive on displacement so that we have not considered them in the ratings shown in Table III-26. However, this possibility of displacement raises a question about the high level of success shown for these projects.

e. Other performance/effectiveness measures. Table III-27 shows several other activities engaged in by four High/Low Visibility projects. Most of these activities revolve around stolen property. Two of these project activities appeared successful, one was rated a Probable Failure, and one could not be rated on the basis of existing evidence since the data pertained to the entire city rather than the project's target area.

5. Comparison of success/failure criteria. Figure III-3 graphically depicts the combined success, combined failure, and Unknown ratings for the High/Low Visibility patrols on the various measures under study. The few expert opinion ratings are not always shown separately since their inclusion in the overall ratings does not bias the figures shown.

The combined success ratings shown in Figure III-3 are quite impressive. Failure ratings are quite low. The highest failure level appears for cost-effectiveness; this is largely based on evaluator's reports of the costliness and ineffectiveness of mechanical devices.

TABLE III-23

HIGH/LOW VISIBILITY PATROLS: ARREST PERFORMANCE AND EFFECTIVENESS

PROJECT	TYPE/SOURCE	H/LVP	COMPARISON/CRITERIA	RATING
Greensboro	Unknown			U
Portsmouth	Percent of total burglary arrests: Evaluation	H/LVP accounted for 43.5% of all burglary arrests	Over a 9-month period	QS
Indianapolis	Increase in 1st degree burglary arrests: Evaluation	Up 79% in target area	Compared to year before H/LVP; compared to 15% increase in nontarget areas	PS
	Percent of total 1st degree burglary arrests: Evaluation	18.5% of all 1st degree burglary arrests in the target areas were by H/LVP	Compared to other (unspecified) units in the target areas	PS

CONTINUED

1 OF 2

The overall success of the projects is indicated in Table III-28.

TABLE III-28

HIGH/LOW VISIBILITY PATROLS:
PERCENTAGE OF DIFFERENT RATINGS ON SELECTED MEASURES

RATING	PERCENT
SUCCESS	17
PROBABLE SUCCESS	57
QUALIFIED SUCCESS	15
FAILURE	2
PROBABLE FAILURE	6
QUALIFIED FAILURE	3

From these data, it appears that one could consider the High/Low Visibility projects as at least a Probable Success. This conclusion, of course, is tentative, due to the questionable reliability of much of the data.

6. Community/department impact. Table III-29 lists various effects which the High/Low Visibility patrols may have had on their community and the broader society.

These data suggest that some displacement of crime may have occurred in three sites; that six of the projects made some impact on the court system; and that citizens appeared to perceive the patrols favorably.

Information from evaluations of five projects indicate that morale was good to very high among the specialized units in Portsmouth, Virginia Beach, Denver, San Francisco, and Portland. Two projects (Portsmouth and San Francisco) were a cause of some initial dissension within their departments. The patrols in Indianapolis and Virginia Beach reportedly enjoyed good relationships with other departmental units whereas little cooperation reportedly existed between the Denver patrol and other units within the department. There was no indication that the more negative cases cited affected the performance or effectiveness of the specialized patrols.

7. Insight into success and failure. Good planning, recruitment of high performers, and specialized training appeared to be partially responsible for the success of the High/Low Visibility family just as they did for the Low Visibility and High Visibility families. Another probable reason for the success of the High/Low Visibility patrols was the flexibility built into their operations, that is, their ability to vary their approach to specific crime problems. The management tool of peer review also appeared noteworthy in accounting for the success of the Virginia Beach project. Failures appeared to center around means of using costly equipment (e.g., helicopters, surveillance vans, remote alarms) and the use of volunteer overtime personnel.

TABLE III-29

Part 4

Comparisons of Project Families

In the Product 4 report, comparisons were made of the different families on each criterion related to success and failure. In this summary report, these data have been vastly condensed because of the large number of Unknown ratings obtained for the Low Visibility and High Visibility patrols on various measures. The comparisons here center around three criteria--amount of change, arrest performance and effectiveness, and crime reduction--and around a comparison of the levels of success and failure. The comparison includes all criteria of success and failure included in this study.

A. Success and Failure: Selected Criteria

Figure III-4 graphically depicts the percentage of combined success, combined failure, and Unknown ratings for the three patrol families on the amount of change, arrest, and crime reduction measures. Expert opinion ratings appear in the crosshatched part of the bars and correspond, generally, to the percentage of Unknown ratings for the combined evaluation/crime figures data.

If one considers expert opinion, the Low Visibility patrols exceeded the other patrol families in effecting positive change. Using only evaluation/crime figure data, the High/Low Visibility family exceeded in amount of change.

The High/Low Visibility family clearly exceeded other families in arrest and crime reduction performance and effectiveness and showed fewer failures in these areas than the other patrol families. The High Visibility family exceeded the Low Visibility family in crime reduction, even if one includes the expert opinion in the Low Visibility group. The Low Visibility group did show a higher level of success in arrests than the High Visibility projects if one includes expert opinion; however, the level of failure on the arrest measure was also higher for the Low Visibility than for the High Visibility group.

Such data as exist on other measures do point to more success than failure for each of the patrol families.

B. Level of Success and Failure

Using all available ratings, IHRR calculated the overall percent of success and failure for each point on the success and failure scales. These data appear in Table III-30.

Given the fact that Success/Failure ratings are highly dependent upon the level of reliability of the data, the figures shown in Table III-30 are as accurate a portrayal as can be made on the level of success or failure attained by each patrol family. With considerable reservations as to whether specialized patrols should be judged on such questionable data, the Low Visibility patrols and the High/Low Visibility patrols are rated as a Probable Success and the High Visibility patrols as a Qualified Success. The Failure ratings shown in Table III-30 can be attributed largely to two factors:

- . The general lack of success of two projects (the HIT programs in Henrico County and Alexandria, Virginia)

FIGURE III-4

QUALIFIED FAILURE	--	--	--	3%

- (1) Represents evaluations and/or crime figures only.
(2) Represents expert opinion only.

- . The high cost, noneffectiveness and partial nonuse of mechanical devices in four sites (Henrico County, Portsmouth, Indianapolis, and Virginia Beach). These devices included alarm systems, surveillance equipment, and a helicopter patrol.

This latter finding should not be misconstrued as an indictment against mechanical devices. The study sample is small and the evaluations were not centered on these devices. In fact, many evaluators had nothing to say about the use of mechanical devices, even when they were part of the department's specialized patrol. What IHRR field personnel did observe, however, was a tendency in some sites (including sites not covered in this report) toward nonuse--rather than misuse--of highly specialized equipment. The reasons for this disuse were never made totally clear to IHRR observers; however, it is possible that some departments may need technical assistance from LEAA on ways of maximizing the benefits of technological equipment. More careful examinations of mechanical devices, such as the MITRE study of early-warning robbery reduction devices,²⁵ are recommended in order to understand better the uses and benefits of sophisticated, technological equipment.

IV. A TENTATIVE KNOWLEDGE BASE AND KNOWLEDGE GAPS

From the literature search, the field survey and the various analyses of the data, a tentative knowledge base was amassed and major gaps in knowledge were identified. Both are summarized in this chapter.

A. A Tentative Knowledge Base

According to survey estimates, police departments serving cities with populations of 50,000 persons or more tend to rely heavily on specialized patrol tactics. The tactics most frequently used are (in order of frequency):

- . Civilian dress
- . Uniformed tactical
- . Mechanical devices

The choice of a particular tactic, or tactics, appears to rest, in part, on certain basic assumptions regarding the efficacy of different levels of police visibility.

A belief in the efficacy of increased visible police presence seems related to the choice of a uniformed tactical tactic. The uniformed tactical unit is expected, first and foremost, to deter crime and only secondarily to increase apprehension of target criminals.

A belief in the efficacy of invisible police presence, on the other hand, appears to be related to the choice of a civilian dress unit and occasionally to the use of mechanical devices such as night vision scopes, alarm systems, and other sophisticated technological equipment. These tactics are expected, first and foremost, to increase apprehension of target criminals and only secondarily to deter target crimes.

These assumptions regarding the efficacy of different visibility levels were used to identify two basic types of specialized patrols: a High Visibility family and a Low Visibility family. The former relies only on uniformed tactical tactics while the latter relies on civilian dress and/or mechanical devices.

But there was still a third assumption, one that combined the visibility levels and the tactics. This was called a Combined High/Low Visibility family. All projects of this type rely on a uniformed tactical tactic as well as civilian dress and/or mechanical device tactics. These multitactic units are expected to both deter crime and increase apprehension of target criminals.

A sound knowledge base will provide answers to several questions. Which of the above assumptions is correct? Is one or more correct only under given circumstances? Which tactic is most effective? Are some more effective only under given circumstances?

A sound, comprehensive knowledge base will also answer one basic, implicit question: Is a specialized patrol more effective and efficient than a traditional patrol for combatting certain forms of crime?

After searching through numerous reports, it was concluded that definitive answers to these questions have not been forthcoming from evaluative research. However, an intensive analysis of a selected sample of projects did yield a tentative set of conclusions which are based on descriptive material of the settings in which specialized patrols operate and simple, quantitative analyses related to performance and effectiveness. These tentative conclusions are summarized in the following subsections.

1. A common setting. In reviewing the evaluations of specialized patrols, it was found that evaluators have given almost no attention to the setting in which these patrols operate. A simple analysis of existing descriptive material indicates that all three families of specialized patrols tended to operate in a similar setting. There were differences, of course, but the deviations to the patterns described below were proportionately similar across project families.

- Recruitment and selections criteria--The majority (60 percent or more) chose the best men from the department and about one fourth of each family type used volunteers and/or overtime regulars at least in supplementary capacities.
- Training--The majority offered at least some specialized training relevant to the patrol family.
- Planning--From 60 to 100 percent of all family types relied heavily on crime analysis in planning; High Visibility patrols did show a slightly higher tendency to rely more on other sources (e.g., investigative information) than other family types.
- Monitoring--For the majority of each family type, monitoring was largely a function of the specialized patrol unit.
- Internal data comparisons--At least one half of all family types performed internal comparisons and/or evaluations of specialized patrol activities.
- External evaluations--About one half or more of all project types have been evaluated by outside personnel (though often in cooperation with the department, State Planning Agency, or a related agency).
- Experimentally initiated--From available data, it appears that each family has a fairly equal proportion of experimental projects (50-60 percent).
- Span of control--The majority of all family types operated with one sergeant to ten or less men (usually eight officers).
- Deployment--From 75 to 100 percent of each family type relied largely on crime analysis to deploy personnel.
- Operational modes--The majority of all family types (75 to 100 percent) relied on crime and location-oriented operational modes. High Visibility patrols were more prone to rely on a suspect orientation than other family types: 40 percent of the High Visibility

patrols utilized a suspect orientation as compared to 12-25 percent of the other patrol types. However, the data strongly suggest that all family types relied on a suspect-oriented mode, at least on occasion, and that mention is simply not made of the use of this operational mode.

- . Methods--All family types, of course, utilized patrol methods (e.g., roving patrol, saturation patrol). Surveillance and stakeout were methods common to all families as well. Decoy methods obviously were not part of the High Visibility patrols' activities. Nor was air patrol which was part of the methods of a few Low and High/Low Visibility patrols.
- . Crime targets--Each family type was represented by some projects (25-63 percent) that were concerned with combatting all or most types of serious crimes (e.g., homicide, assault, rape, burglary, robbery, larceny). All were represented by some projects mainly focused on burglary or robbery. A higher proportion of Low and High Visibility patrols did tend to focus more on robbery than burglary while the opposite was true for the High/Low patrols.
- . Targets of Intervention--All family types were concerned with protecting commercial as well as noncommercial establishments and, consequently, businessmen as well as other citizens.

The data on how specialized patrols fit into the organization of their departments, how they are funded, and the amount of yearly appropriations are not complete. However, such data as exist show that the specialized patrols tend to be within the special operations division or patrol division, regardless of family type, and that one type is no more likely than another to be the recipient of a Federal grant ranging from about \$250,000 to around \$1 million. (One High Visibility patrol did receive a \$7 million grant.)

Finally, despite the setting of many specific subobjectives by some patrol projects, all tended to focus on the same major objectives: crime reduction; increased arrests; and, to some extent, increased conviction and/or clearance rates, maintenance of public safety and respect, and the enhancement of citizen involvement in patrol activities.

From descriptive data, one also can describe a composite or typical patrolman in his working setting. He tends to be young, chosen from among the highest performers in traditional patrol, and satisfied with his work in specialized patrol. He is one of eight to ten officers who often work in small teams under the direct supervision of one sergeant. The specialized patrolman's activities and deployment are planned on the basis of crime analyses and his work tends to be monitored by his own unit. To accomplish his major tasks better--apprehension and crime deterrence--he receives special training in the tactics and methods he will use to accomplish his objectives. His work tends to be perceived favorably by his department and by the community which he serves.

2. Success and failure. The analytic data related to the performance and effectiveness of specialized patrols rests upon a data base of questionable accuracy and reliability. From the rather gross ratings on this questionable

data base, each of the project families appears rather successful in meeting its primary objectives of crime deterrence and apprehension. The ratings show the High Visibility patrols as more successful at deterrence (their major mission) than at apprehension. The reverse trend appeared for the High/Low Visibility patrols; that is, they were slightly more successful at apprehension than deterrence. The Low Visibility patrols were most difficult to assess since there were so few evaluations on this group; however, the combined data from evaluations, crime figures, and expert opinion show this group as being slightly more successful at deterrence than apprehension (their major mission). The data on other performance and effectiveness indicators were scant, but the trends for the change effected on selected criteria and for increased clearances and convictions tended to be positive. That is, there were more successes than failures.

The data further suggest that a combined use of uniformed tactical and civilian dress tactics may be the most successful approach, perhaps because it provides departments a greater degree of flexibility in solving difficult and complex problems.

Mechanical devices did not receive much attention in the evaluations analyzed in this study. Some documentation was available on the use of sophisticated technological equipment in six sites. In four of these sites, the devices accounted for a considerable proportion of the few failure ratings on the specialized patrols covered in the study. The reasons for these failures were not totally clear; however, it appeared that such equipment was either misused or not used at all so that evaluators assessed the devices as costly and ineffective aspects of the patrols' operations. The efficacy of these mechanical tactics, obviously, requires far more study before generalizations can be made from the few and generally inadequate evaluations covered in this study.

B. Deficiencies in the Knowledge Base

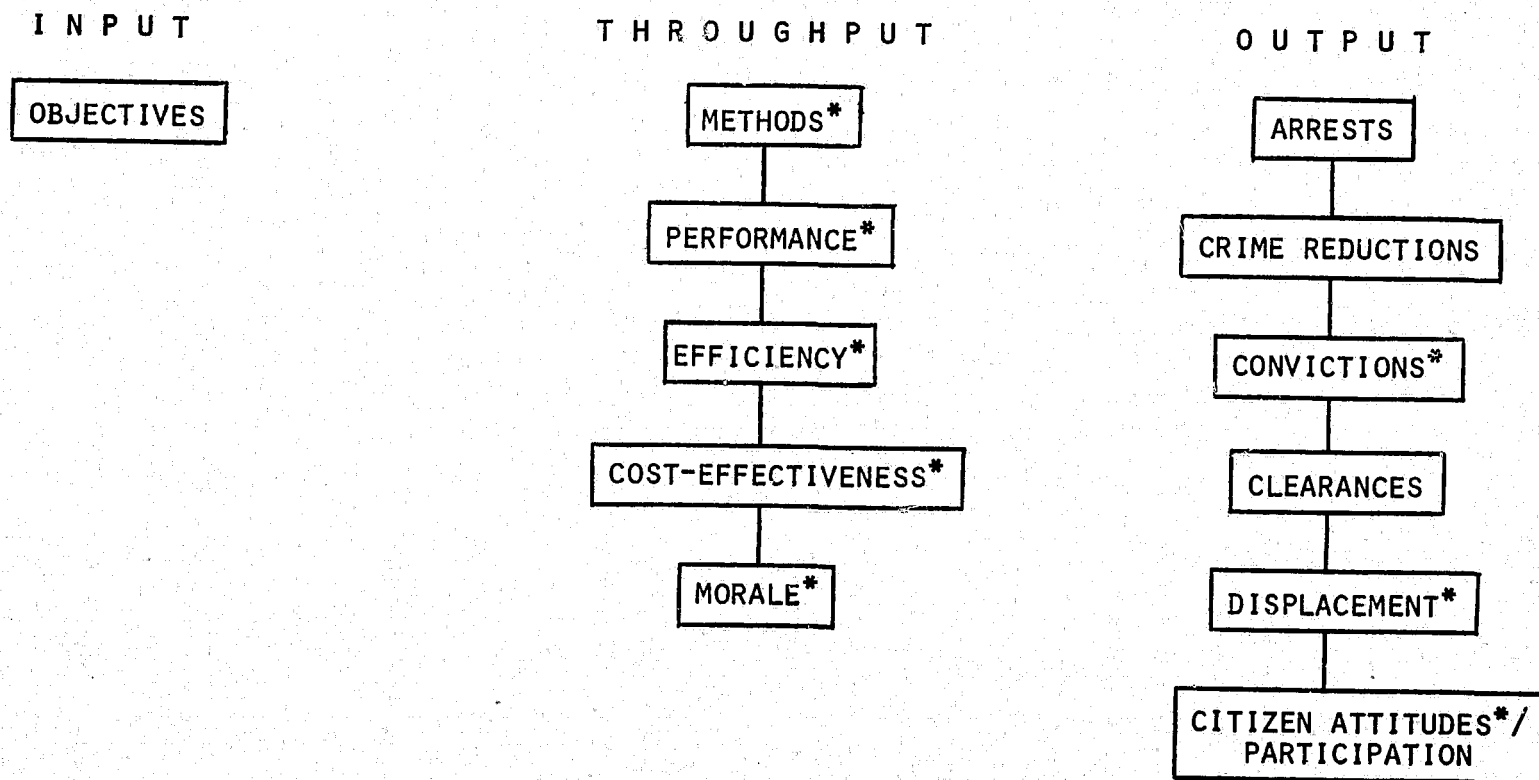

This section addresses the deficiencies, or gaps, in the knowledge base on specialized patrols, the reasons for these gaps in knowledge, and briefly touches on the problems of filling these gaps.

1. Gaps. What is known definitively about each variable listed in the analytic model (see Figure I-1) or about the intervening variables that could affect specialized patrol operations (see Table II-2)? The answer is: Very little. All these subject areas represent deficiencies in our knowledge on specialized patrols.

Only a few of these areas have even been subjected to an evaluation. Those variables typically included in evaluations are shown in Figure IV-1, with indications of those that have been evaluated only infrequently.

On the input side of the model, only the objectives have been tested. On the throughput side, there have been a few tests of methods (e.g., stakeout, decoy) and some evaluation of the process measures listed (performance, efficiency, cost-effectiveness, morale). The major focus has been on the primary outputs, especially arrest and crime reduction effectiveness. A few studies also addressed increases in clearance and conviction rates. The specialized patrols' impact on the communities they serve and the broader society (secondary outputs) has received only scant attention. Some very inadequate tests have been made of crime displacement and some evaluators have addressed citizen attitudes toward the patrols and/or their participation in prevention activities (e.g., target hardening, public education). Only rarely have these studies of citizens been

FIGURE IV-1
VARIABLES MEASURED ON SPECIALIZED PATROL

*MEASURED ONLY INFREQUENTLY.

based on good survey methodology. Except for citizen attitudes, none of the intervening variables identified in Table II-2 appear to have been addressed.

2. Reasons for the gaps. There are many explanations for the gaps in knowledge. One lies in the very complexity of the subject area. Another, but related, explanation lies in the lack of adequate research technology that would permit one to study every possible variable that might affect specialized patrol operations. Another is a more pragmatic consideration. That is, even if research methods were available to study all possible variables effecting the specialized patrols, the cost of such a study would probably be prohibitive.

Even in view of these considerations, the most important gaps in knowledge appear to have been created unnecessarily by:

- . Use of poor study designs
- . Failure to use adequate comparison groups
- . The use of noncomparable measures for studying the same phenomenon

The study designs fail on many scores. Most important among these are the failure to control for the interventions of nonspecialized personnel in the target areas assigned to specialized personnel, inadequate tests of displacement, the use of short-term measures and, especially, the failure to take into account the selection criteria for specialized patrol personnel. Since departments tend to choose the best performers to serve on specialized patrols, the evaluators have not utilized well-matched comparison groups; what has been studied primarily (but inadequately) is personnel selection rather than project assumptions or tactics. The picture is additionally confused by the use of many different performance and effectiveness measures, some of which are of questionable reliability and comprehensiveness.

C. Filling the Gaps

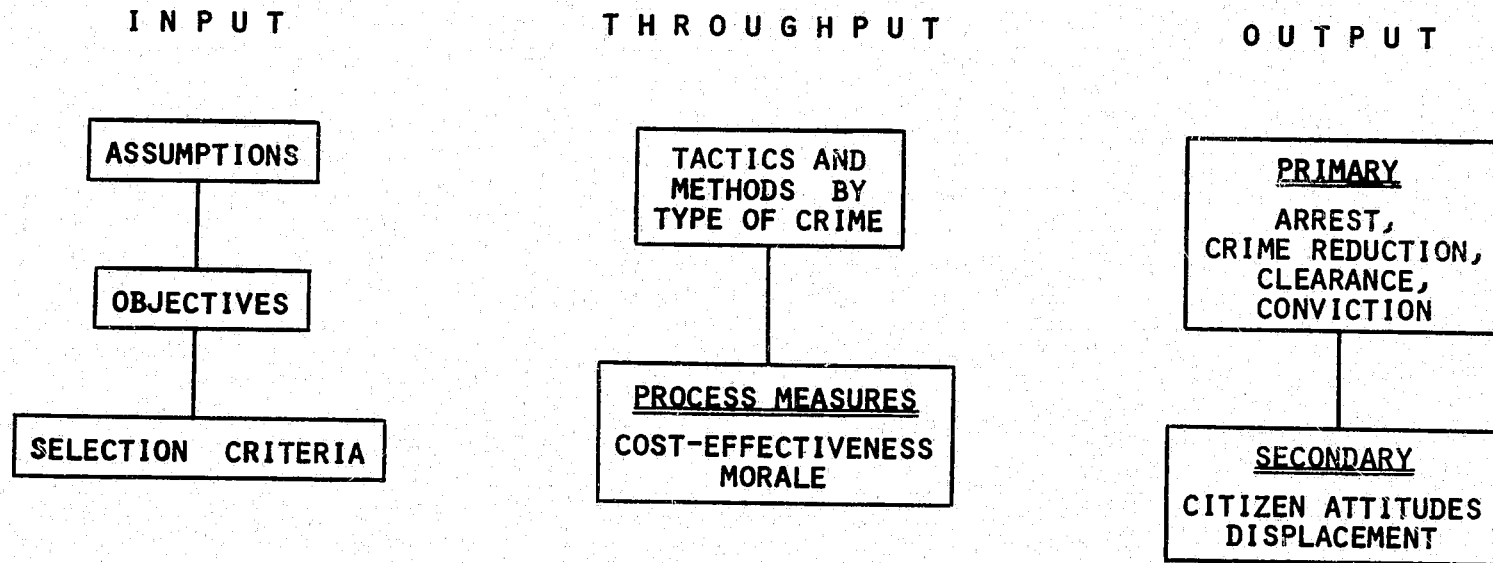

One could write a lengthy text on ways of filling all the gaps in knowledge on specialized patrols. In another report, we have taken a pragmatic approach in addressing this problem.²⁶

This approach recognizes that choices must be made; that one should first identify the most important gaps and set about to answer basic questions which will provide law enforcement personnel information they need to make decisions on crucial issues. This pragmatic approach also takes into consideration budget constraints and the exorbitant cost of a study that would attempt to fill all the existing gaps.

In order to fill the most important gaps identified in Figure VI-2, two basic types of studies should receive first priority:

- . Studies that will test the implicit assumption that specialized patrol will be more cost-effective than traditional patrol in certain crime situations

FIGURE IV-2
IMPORTANT KNOWLEDGE GAPS

- . Studies that will test the assumptions, tactics, and methods underlying the existence of project families and permit comparisons of the effectiveness (including cost-effectiveness) of different visibility levels, tactics, and methods by type of crime

Until these questions are answered, departments will not be provided the basic information required to help them in project planning, monitoring, and management.

25. A recently-completed study by the MITRE Corporation suggests that projects utilizing early-warning robbery reduction devices achieve their basic objective of reducing the incidence of robbery. They also appear to enhance the capability to apprehend and convict robbery suspects. However, projects may be prevented from demonstrating their capability to improve apprehension and conviction rates because they reduce the incidence of attempted robberies. As the MITRE investigators note, evaluative data in this field are simply insufficient to establish the degree of success attained by early-warning robbery devices. (The same problem appears to exist for other mechanical devices.) See Eliot, Warner A., Strack, John R., and Witter, Alice E. Early-Warning Robbery Reduction Projects: An Assessment of Performance. McLean, Virginia: MITRE Corporation, 1975.
