## SECTION A: INTRODUCTION

This report represents the second in a series of statistical reports prepared and disseminated by the staff of the Governor's Commission on Law Enforcement and the Administration of Justice in an effort to describe the existing system as well as anticipated trends in criminal and juvenile justice system processing. It is hoped that this report and the others in the series will provide a base of information for making more systematic and rational choices about the needs and objectives of the criminal and juvenile justice system. Among these objectives would be concern for such questions as crime reduction, improvement in the administration of justice, and reduction in the total cost of crime control.

This report provides a description of the results of projections of adult and juvenile arrests for each jurisdiction in the State of Maryland through the year 1990. The first report in this series provided a description of criminal and juvenile justice processing for each county of the State and Baltimore City for FY 1977. This report expands upon this existing system description to include projections of the expected future volume of juvenile and adult arrests. Subsequent reports in this series will provide information on the cost of criminal justice processing and the impact of alternative policies on future criminal and juvenile justice processing.

The arrest projection model described in this report was developed in an attempt to provide policy makers, administrators, and planners in the criminal and juvenile justice area with information that might prove beneficial in anticipating future needs and objectives. The estimates of future arrests can be used in conjunction with existing criminal justice system descriptions to anticipate potential problem areas. For example, suppose the current likelihood of being convicted for a particular crime and the subsequent likelihood of being sentenced to State probation is assumed to remain the same throughout the next decade. Then applying these probabilities (or likelihoods) of conviction and subsequent sentencing to probation to the estimates of future arrests will provide an estimate of future probation intake.

In brief, the arrest projection model operates under the assumption that arrests have been (and will continue to be) numerically related to demographic factors in a jurisdiction's population, e.g., age, race, sex, and population density. The report describes the existing relationship between arrests for various crime types and age, race, and sex groupings and a jurisdiction's general population as described by these same characteristics of age, race, and sex. Making the assumption that the existing relationships between a jurisdiction's arrest population and general population will continue to hold true in the future and that no dramatic changes will occur in law enforcement arrest policy, then the projections of juvenile and adult arrests for 1980, 1985, and 1990 are made. The results of these projections show an anticipated increase in total adult arrests over the period 1977 through 1990 of approximately 20.0% State-wide and an anticipated decrease in juvenile arrests of approximately 3.0% State-wide for this same time period.

## SECTION B: DESCRIPTION OF THE ARREST PROJECTION MODEL

### I. Methodology

In making the arrest projections, arrest rates were determined based on the number of arrests for a particular segment of the arrest population per 100,000 of the segment of the general population with the same characteristics. The number of arrests and the population were characterized by a number of attributes (e.g., age, race, and geographic area). In addition, arrests were characterized by specific crime types. Therefore, arrest rates for a given type of crime and with specific demographic characteristics (e.g., age, race, and geographic area), were generated per 100,000 of the general population with the same demographic characteristics. Specifically, these arrest rates were calculated by dividing the number of arrests for a particular crime type (e.g., criminal homicide) and particular arrest group (e.g., white juveniles arrests) by the total population of a group with similar characteristics (e.g., total juvenile white population) and then multiplying the result by 100,000. These arrest rates for various segments of the arrest population were determined since an analysis of the arrest rates for the years 1975, 1976, and 1977 showed that the arrest rates vary significantly as a function of the type of crime and within crime type the age, race, and sex of the arrest population. These differences in the arrest rates by type of crime and within crime type by age, race, and sex were found to hold true both State-wide and for the various jurisdictions of the State. In addition, a comparison of the 1975, 1976 and 1977 crime, age and race-specific arrest rates showed that these arrest rates were reasonably stable over this three year period.\*

In projecting arrests, the arrest rate relationships provided a basis for estimating future volumes of arrests based on changes over time in the demographic mix (e.g., age, race, and sex) of a jurisdiction's population. It was assumed that changes over time in the age, race, and sex distribution of the population and/or absolute changes in the number of persons in particular age, race, and sex groupings might have a numerical relationship to the future number of arrests. This would appear to be particularly true if changes in the demographic mix over time were to impact most strongly on those age, race, and sex groupings which presently have the highest likelihood of arrest (assuming these high arrest rates remain the same or nearly so over the near future).

There are, no doubt, other variables which may have a significant influence on the number of current as well as future arrests. However, information on age, race, and sex by geographic area were the only common, readily available variables describing both the general population and the arrest population of the jurisdictions of the State. Presently, complete arrest statistics by crime type for the jurisdictions of the State are only available starting in calendar year 1975. In addition, while arrest data by crime type was available by age and sex groupings, only aggregate arrest data by crime type was available by race. That is, only total juvenile and total adult arrest data by crime type and race was available.

---

\*Since State-wide arrest data of acceptable quality for this type of analysis is only available for the years 1975, 1976, and 1977 it is difficult to say at this time how stable these arrest rates have been in the past or will be in the future.

Given these limitations on the availability of data, a method for estimating future arrests based on 1975, 1976 and 1977 data was determined. It was decided that the arrest projections would be made separately for each county and Baltimore City. By performing the projections by geographic area (i.e., the counties and Baltimore City) an effort was made to account for differences in population density (another variable which appears to be associated with a jurisdiction's arrest rate) throughout the State. Within each of the jurisdictions, the arrest projections were made by type of crime and within each type of crime for each of the age groupings. Age groupings were chosen to focus more heavily on those age groupings which constitute a large portion of the arrest population, specifically  $\leq 12$ , 13-14, 15-16, 17, 18-19, 20-24, 25-29, 30-34, 35-39, and 40+. The types of crime were selected mainly to emphasize Part I arrests. In addition, crime types for which large disparities in the number of reported arrests occurred during the course of 1975-1977 (i.e., "All Other Offenses" and "Assaults" both Aggravated and Other) were selected in order that their contribution to the total projected arrests could be easily identified.\* Therefore, the arrest projections were made for each of the Part I arrests (i.e., Criminal Homicide, Forcible Rape, Robbery, Aggravated Assault, Burglary, Larceny, and Motor Vehicle Theft), as well as for the "Other Assaults" and "All Other Offenses" arrests and the remaining Part II crime arrests combined.

The arrest projections were made for 1980, 1985, and 1990 using the 1975, 1976, and 1977 arrest data as provided by the Maryland State Police Uniform Crime Reporting Program.\*\* Thus, three estimates of the future volume of arrests by crime and age were generated using each of the three base years of arrest data. The first estimate of the future years (e.g., 1980) arrests was generated by using 1975 arrest and population data as the base year in the arrest projection model, the second estimate was generated by using 1976 arrest and population data as the base year in the model, the third estimate was generated by using 1977 arrest and population data as the base year in the arrest projection model.

Initially, the base year (i.e., 1975, 1976, or 1977) arrests for each jurisdiction, crime type, and age grouping were multiplied by the projected ratio of future year (i.e., 1980, 1985, or 1990) to base year (i.e., 1975, 1976, or 1977) population for the same jurisdiction and age grouping. This assumed that the initial crime type arrest projections for the future year (i.e., 1980, 1985, or 1990) for each jurisdiction, crime type, and age grouping

\*In some jurisdictions, increased reporting and/or new agencies reporting was evidenced by a significant rise in arrests in the "All Other Offenses" category. Additionally, some jurisdictions changed their definition of what constitutes an aggravated assault during the period from 1975-1977, to include offenders formally counted under "Other Assaults".

\*\*See Section on arrest data input and its reliability for more complete details.

was simply the change in the jurisdiction's population from base to future year for the age grouping times the number of actual arrests for that jurisdiction for the specific crime and age grouping for the base year (i.e., 1975, 1976, or 1977).\*

This method of estimating future arrests only took into account the absolute change from the base year to the future year (e.g., 1977 to 1980) in population for each age grouping within a jurisdiction. In addition, the 1975, 1976 and 1977 white and non-white arrest rates for a particular crime type differed significantly within a jurisdiction and by age grouping within the jurisdiction. This would affect future arrest volumes should such differences in the arrest rates continue to exist. Since arrest data by crime type were not available by race for each age grouping, but was available by aggregated age grouping (i.e., juvenile/adult) a technique was used to adjust the future year (i.e., 1980, 1985 and 1990) arrest projection figures to reflect any relative change in both the juvenile and adult white/non-white population mix from the base year to the projected year (e.g., 1977 to 1980).

Adjustment factors were developed for each jurisdiction using: (1) the overall base year arrest rates for the juvenile white and non-white populations and the adult white and non-white populations for each crime type; and (2) the relative change for each age grouping between base and future year in the white/non-white population proportion for the jurisdictions. The resulting adjustment factors account in part for any projected change in the relative proportion of whites and non-whites in both the juvenile and adult population within a jurisdiction over the period from base to future year (e.g., 1977-1980).\*\* It should be noted that a similar type of adjustment factor was considered to adjust for the differences in the arrest rates for males and females. However, based on the projected population figures, there appeared to be no significant change over time in the ratio of males to females within the age groups. Therefore, including in the ratio a factor to reflect changes in the male/female population distribution would not have affected the resulting number of projected arrests.

\*Expressed in terms of a formula the projected year arrests (e.g., 1980, 1985, or 1990) for a specific crime type (C), jurisdiction (J) and age grouping (A) using a particular base year's (e.g., 1975, 1976, or 1977) data were:

$$\text{Proj. Yr Arrest Projection for C, J and A} = \frac{\text{Proj. Yr. Pop. for J\&A}}{\text{Base Yr. Pop. for J\&A}} \times \text{Base Yr. Arrests for C, J and A}$$

\*\*The adjustment factor used to compensate for the change in both the juvenile and adult white/non-white population mix between base and projected year can be expressed in terms of the following formula for a specific crime type (C), jurisdiction (J), age grouping (A), and respective aggregated age grouping (Ju/Ad) (i.e., juvenile or adult).

$$\begin{array}{l} \text{Adjustment Factor} \\ \text{for Arrests for} \\ \text{C, J and A} \end{array} = \frac{\frac{\text{Proj. Yr W Pop. for J and A}}{\text{Total Proj. Yr. Pop. for J\&A}} \times \text{Base Yr. Ju/Ad W Arrest Rate for J \& C} + \frac{\text{Proj. Yr. N-W Pop. for J\&A}}{\text{Total Proj. Yr. Pop. for J\&A}} \times \text{Base Yr. Ju/Ad N-W Arrest Rate for J\&C}}{\frac{\text{Base Yr. W Pop. for J\&A}}{\text{Total Base Yr. Pop. for J\&A}} \times \text{Base Yr. Ju/Ad W Arrest Rate for J \& C} + \frac{\text{Base Yr. N-W Pop. for J\&A}}{\text{Total Base Yr. Pop. for J\&A}} \times \text{Base Yr. Ju/Ad N-W Arrest Rate for J\&C}}$$

The adjustment factor was then multiplied by the unadjusted future year projections for a specific crime type, jurisdiction, and age grouping to arrive at an adjusted estimate of the future year arrests for the specific crime type, jurisdiction, and age grouping. The formula for determining the adjusted arrest projection was:

$$\begin{array}{l} \text{Adjusted Arrest} \\ \text{Projection for} \\ \text{C, J and A} \end{array} = \begin{array}{l} \text{Future Year Projected} \\ \text{Arrests for C, J and A} \end{array} \times \begin{array}{l} \text{Adjustment Factor} \\ \text{for Arrests for} \\ \text{C, J and A} \end{array}$$

Appendix E contains a listing of the computer program used to generate the arrest projections in the manner described above.

## II. Arrest Data:

### A. Description of the Arrest Data used in the Model

As stated previously, the arrest data used in the model was that generated by the State's Uniform Crime Reporting Program. This program has been operational since January 1, 1975.\* It involves the uniform compilation, classification, and analysis of crime statistics reported by all law enforcement agencies of the State pursuant to guidelines and regulations prescribed by law. Under this program, all law enforcement agencies are required to submit specified Uniform Crime Reports. The responsibility and authority for collection and dissemination of UCR data rests with the Maryland Department of Public Safety and Correctional Services (State Police) as specified under Article 88B, Sections 9 and 10, of the Annotated Code of Maryland.

To insure uniformity in reporting, the offense classifications used by the Federal Bureau of Investigation's Uniform Crime Reporting System have been adopted in Maryland. Under this system, offenses are divided into two major groupings: Part I and Part II offenses. The following chart, Figure 1, relates the offense classification used by the UCR Program to the offense classification used in the arrest projection model.

### B. Discussion of the Reliability of the Arrest Data Used in the Model

It should be noted that State-wide uniformity in reporting is still dependent on the proper classification of offenses by the police. Some data inconsistencies in arrests for particular crime types have been noted due to misinterpretations of, or ambiguities in, the UCR offense classification. Specifically, some jurisdictions have changed their definition of what constitutes an aggravated assault after the onset of reporting (to include offenses formerly counted under Other Assaults) in order to correspond with the State-wide definition. This change in definition has resulted in a significant increase in aggravated assaults for these jurisdictions. In addition, where in 1975, 102 agencies reported to the Maryland UCR program, 135 did so in 1977. This increase in agencies reporting also is reflected in some increases in arrests in the counties involved. For example, the Prince George's County Sheriff's Office only began reporting in CY 1977 with most of their arrests for the "All Other Offenses" UCR crime type. Hence a large

\*Prior to this date the Maryland State Police collected certain crime statistics but did not collect complete arrest information by the jurisdictions of the State.

\*Drunkenness - Not reported in Maryland

increase in overall arrests and in particular for "All Other Offenses" was noted in Prince George's County arrest statistics in 1977 as compared to the previous 2 years.

The problems with the UCR data which have just been referenced are in some sense due to the "newness" of the UCR program and should decrease with time. It should be noted that these deviations do not appear, however, to be widespread. For example, changes in classifying aggravated assault arrests are known to have occurred in only two counties. The arrest projections were done in such a way as to generally allow these fluctuations as well as random fluctuations in the arrest data to be detected. This was done by performing projections using arrest data for each year (1975, 1976, and 1977) as input to the model to generate the three corresponding sets of projections and by performing the projections for each of the groupings of the crime types. It is hoped that this will provide a more reliable indication of the range of future arrests.

Appendix A contains a complete listing of the resulting arrest projections by crime type and age grouping as specified previously for each county and Baltimore City. Three tables are included for each of these jurisdictions corresponding to the arrest projections generated using 1975, 1976 and 1977 arrest and population data as base year data respectively. Included in the appropriate table is the actual number of 1975, 1976 and 1977 arrests by crime type and age groupings respectively.

Appendix B contains a graphical display of the resulting arrest projections for each county and Baltimore City. Two sets of graphs are included for each jurisdiction, one for juveniles and one for adults. The following crime groupings are used in these displays, Part I (less Aggravated Assault), All Assaults (Aggravated and Other), Part II (less Other Assaults and "All Other Offenses"), the "All Other Offenses" UCR crime category and Total Offenses. Each graph contains three series of projections one for each of the three base years. It is hoped that this will provide the reader with a sense of the range of projected arrests as well as provide some indication of the reliability of the arrest data both for the actual years and the projected values.

### III. Population Data:

#### A. A Description of the Population Data Used in the Model

The population data used in the arrest projection model was, for the most part, taken directly from the Maryland Projection Series on Population and Employment for 1975-1990.\* The population projections presented in this series were generated in 5 year intervals through the year 1990 for each county in Maryland and Baltimore City. These projections were performed for the following age, race and sex groupings concurrently: 1) age - 0-4, 5-9, 10-14, 15-19, 20-24, 25-29, ..., 70-74, 75+; 2) race - white, non-white; and 3) sex - male, female. The age groupings used in the Maryland Projection Series on Population and Employment did not coincide completely with the age distribution of the available UCR arrest data. It was therefore necessary to apply a simple estimation procedure to the projected population figures (listed in the Maryland Projection Series on Population and Employment) so

\*Reference: Maryland Projection Series Population and Employment (1975-1990) Preliminary - May, 1977 Revisions by Maryland Department of State Planning.

that the age distribution of the two data sources would correspond and so that the juvenile population ( $\leq 17$  years of age) could be distinguished from the adult population. In addition, it was necessary to estimate the 1976 and 1977 population figures since these were not included in the report (i.e., the Maryland Projection Series on Population and Employment for 1975-1990).

Subsection B which follows summarizes the methodology used by the Maryland Department of State Planning to generate the population projections for 1975, 1980, 1985, and 1990 by race and age. More detailed documentation of this methodology is included in the reference listed on the previous page. Subsection C describes the procedure used by the staff of the Maryland Governor's Commission to disaggregate the projected population in the 10-14 year and 15-19 year groupings, as well as the technique used to estimate the 1976 and 1977 population.

#### B. Population Projection Methodology Used by the Maryland Department of State Planning

In brief, the population projection technique which the Maryland Department of State Planning used involved estimating three components of population change, namely births, deaths and net migration within a 5 year period. The base data they used was from the 1970 Census of Population and Housing First County Summary Tapes which detailed population data by age, race, and sex for each of the 23 counties in Maryland and Baltimore City. The following discussion is an outline of this procedure which they (i.e., the Maryland Department of State Planning) used to estimate the future population in the State. For a more detailed description of this population projection methodology with the actual formulas used, the reader is referred to the reference listed on the previous page.

Initially, the historical population (i.e., as determined by the 1970 Census) was multiplied by 5 year age-specific survival rates to calculate the survived population age 5 and over. The number of births were projected by multiplying the number of females aged 15-44 by projected fertility rates.\* This computed estimate of the projected number of births was in turn multiplied by survival rates, resulting in the projected population aged 0-4. Finally, the survived population aged 5 and over was added to the projected population aged 0-4 to determine the total projected population in a 5 year interval.

---

\*Basically, Bureau of the Census assumptions concerning total U.S. fertility rates were used. The national Series III fertility trend (i.e., 1.7 births per women) was followed in the model through 1985, after which the national Series II trend was used (i.e., 2.1 births per woman).

Next, estimates of net migration (i.e., overall in or out migration) were calculated under the assumption that migration is a function of labor force supply and demand. As such, both the labor force supply and demand were projected for the 5 year period. The resulting projected labor force supply was then subtracted from the projected labor force demand to determine the projected migrant labor force. If demand was greater than supply, then it was assumed that net in-migration will occur. Conversely, if demand was less than supply it was assumed net out-migration will occur. The projected migrant labor force estimate was then inflated to determine the total projected migrant labor force.

Next, the total net migration was allocated by age, race, and sex using historical migration data. The number of births in the migrant population was then estimated in the same manner as the number of births in the total population. Finally, the projected net migrant population was added to the previously estimated remaining population to produce the final population projections.\* Using these projections as the base "historical" data, the whole process was repeated for the next 5 year period (through 1990).

C. Estimation Procedure Used to Disaggregate the Juvenile Population as well as Estimate the 1976 and 1977 Population by Age and Race

As stated previously, the juvenile age distribution of the population projections generated by the Maryland Department of State Planning and the arrest data did not quite coincide. The population figures were presented in 5 year intervals from birth, i.e., 0-4, 5-9, 10-14, 15-19 etc., whereas the juvenile arrests could be grouped in the following way:  $\leq 12$ , 13-14, 15-16, 17. Since the juvenile population in the criminal justice system consists of those persons age 17 or less, it was decided that the population data should be regrouped to correspond to the age distribution of the juvenile arrest data used (i.e.,  $\leq 12$ , 13-14, 15-16, 17). Hence it was necessary to subdivide the 10-14 and 15-19 year old population groups.

The only available complete population data by age was that available from the 1970 Census. To subdivide the 10-14 year old population group in 1975 it was assumed that the distribution of the 10-14 year olds in 1975 was the same as the distribution of the 5-9 year old's in 1970. Similarly, it was assumed that the distribution of the 15-19 year olds in 1975 corresponded to the distribution of the 10-14 year olds in 1970. Similar assumptions were made with respect to the 1980 age groupings. Problems with this method occurred when trying to subdivide the 10-14 year grouping in 1985, and the 10-14 and 15-19 year old age groupings in 1990. Individuals in these groups were not born and hence not counted in the 1970 Census. Consequently, it was assumed that the distribution of these age groups was the same as the

---

\*While not explicitly stated in this narrative, it should be noted that the fertility rates (and all other rates used in the model) were age, race and sex-specific as were the resulting projections.

distribution of the 0-4 year olds in 1970.\* Finally, the 0-4, 5-9 and 10-12 population estimates for each of the years (e.g., 1980, 1985 and 1990) were summed to estimate the  $\leq 12$  year old group for each of the future years (e.g., 1980, 1985, and 1990).

Finally, since the data from the Maryland Department of State Planning was only available in 5 year intervals it was necessary to estimate the 1976 and 1977 population by age and race. This was done essentially by taking a weighted average of the 1975 and 1980 population projections which were listed in the Maryland Projection Series on Population and Employment. Specifically the 1976 population by age group and race was estimated by adding to the 1975 population projections (as determined by the Maryland Department of State Planning) one-fifth the difference between the 1980 and 1975 population projections.\*\* The 10-14 and 15-19 age groupings in this estimate of the 1976 population were then disaggregated in the same manner as explained above. The 1977 population projections were estimated by adding to the 1975 population projections, two-fifths times the difference between the 1980 and 1975 population projections\*\*\* (as determined by the Maryland Department of State Planning). Again, the 10-14 and 15-19 year age groupings were disaggregated as explained above to determine the  $\leq 12$ , 13-14, 15-16, and 17 year old populations.

#### D. Reliability of the Population Projection Methodology

As explained previously, this method is essentially based on 3 components: estimating the number of births, deaths, and net migration within an area in a specified interval of time. Estimation of the number of deaths usually proved reliable since survival rates tend to show relatively little change over time. Projected births, on the other hand, may be subject to changes in an area's population resulting from new attitudes towards birth control and family size, etc. Therefore, if any aspect of the population projections prove inadequate it should be with respect to the projected number of births or with respect to the projected net migration. Since the 1980 and 1985 and to a large extent the 1990 adult population were counted in the 1970 census and since the projected number of deaths usually prove reliable, then assuming the net migration projections are reliable, one could be reasonably confident in the adult population projections and perhaps somewhat less confident in the juvenile population projections.

\*Specifically the 10-14 year olds were disaggregated into 10-12, and 13-14 year age groups while the 15-19 year olds were disaggregated into 15-16, 17 and 18-19 year old groups using the distributional percentages of the appropriate (i.e., assumed) age grouping in the 1970 data.

\*\*The actual formula used to estimate the 1976 population by age (A) and race (R) was:

$$\begin{array}{l} \text{1976 Population} \\ \text{for A \& R} \end{array} = \begin{array}{l} \text{1975 Pop for} \\ \text{A \& R} \end{array} + 1/5 \times \left( \begin{array}{l} \text{1980 Pop} \\ \text{for A \& R} \end{array} - \begin{array}{l} \text{1975 Pop} \\ \text{for A \& R} \end{array} \right)$$

\*\*\*The formula used to estimate the 1977 population by age (A) and race (R) was:

$$\begin{array}{l} \text{1977 Population} \\ \text{for A \& R} \end{array} = \begin{array}{l} \text{1975 Pop for} \\ \text{A \& R} \end{array} + 2/5 \times \left( \begin{array}{l} \text{1980 Pop} \\ \text{for A \& R} \end{array} - \begin{array}{l} \text{1975 Pop} \\ \text{for A \& R} \end{array} \right)$$

Appendix C contains a complete listing of the population estimates (i.e., 1975, 1976, 1977) and projections (i.e., 1980, 1985 and 1990) by age and race for each county and Baltimore City that were used as input to the arrest projection model.

#### IV. Overall Reliability of the Arrest Projection Model

It is important to stress that the reliability of this arrest projection technique is heavily dependent on three factors: 1) the underlying assumption that crime, age and race specific arrest rates remain constant (or at least relatively stable) throughout the estimated period; 2) the reliability of the arrest data used; and 3) the reliability of the population data used.

At this point in time the three years of available arrest data generally support the assumption that the crime, age, and race specific arrest rates are remaining reasonably constant over time. Naturally as this arrest history increases over future years it will become possible to determine whether or not significant changes are occurring in the arrest rates. Adjustments would then have to be made in the arrest projection model to compensate for such changes. For example, it might be hypothesized that as more women enter the work force and in general tend to assume roles previously assumed mainly by men, their tendency to commit crimes will more closely approximate that of the male. This would result in a significant increase in volume of female arrests. Hence arrest rates for females would increase over time rather than remain stable. As such, changes would have to be made in the model to incorporate these increasing arrest rates.

The reliability of the arrest data as well as the reliability of the population projections used in the model have already been discussed in the respective sections of this report and will not be repeated here. In summary, the overall validity of the model is dependent on the reliability of each of the three components specified above.

SECTION C: FINDINGS

I. Introduction

As noted in the previous section, the projected arrests are both crime and age-specific. The crime groupings selected for analysis were the following:

- 1. Criminal Homicide
  - 2. Forcible Rape
  - 3. Aggravated Assault
  - 4. Robbery
  - 5. Burglary
  - 6. Larceny
  - 7. Motor Vehicle Theft
- Part I Offenses
- 8. All Other Offenses
  - 9. Other Assaults
  - 10. Part II (less Other Assaults and All Other Offenses)
- Part II Offenses
- 
- ```
graph LR; 1 --- P1; 2 --- P1; 3 --- P1; 4 --- P1; 5 --- P1; 6 --- P1; 7 --- P1; 8 --- P2; 9 --- P2; 10 --- P2; P1 --- P1_Label[Part I Offenses]; P2 --- P2_Label[Part II Offenses];
```

These particular crime groupings were chosen mainly to emphasize the arrests for Part I or serious crimes. Additionally, crime groupings for which large disparities in the number of arrests occurred during the course of 1975-1977 (i.e., Other Assaults and "All Other Offenses") were selected in order that their contribution to the total projected arrests could be easily identified.

The age groupings selected for analysis were the following: 0-12, 13-14, 15-16, 17, 18-19, 20-24, 25-29, 30-34, 35-39, 40+. These were chosen to focus specifically on those age groupings which constitute a large portion of the arrest population, and so that the juvenile and adult arrest populations could be distinguished. Finally the arrest projections were performed for each county and Baltimore City.

As stated previously, Appendix A contains a complete set of the arrest projections by crime and age grouping for each county and Baltimore City. The actual arrests for 1975 and arrest projections for 1980, 1985 and 1990 generated using 1975 as the base year; actual arrests for 1976 and resulting arrest projections for 1980, 1985, and 1990 generated using 1976 as the base year; as well as the actual arrests for 1977 and arrest projections for 1980, 1985, and 1990 generated using 1977 as the base year are shown.

Rather than attempt to interpret the projections at this level of aggregation, the findings as described in this section will instead be limited to the following crime, age groups and jurisdictions obtained by further aggregating the data.

- 1. Crime Types: Part I (less Aggravated Assaults), All Assaults (Aggravated and Other), "All Other Offenses," Part II (less "All Other Offenses" and Other Assaults) and Total Offenses.
- 2. Age Groups: Juvenile and Adult.

3. Jurisdiction Groupings (District Court districts): 1. Baltimore City; 2. Dorchester, Somerset, Wicomico, Worcester; 3. Caroline, Cecil, Kent, Queen Anne's, Talbot; 4. Calvert, Charles, St. Mary's; 5. Prince George's, 6. Montgomery; 7. Anne Arundel; 8. Baltimore; 9. Harford; 10. Carroll, Howard; 11. Frederick, Washington; 12. Allegany, Garrett.

## II. Overall Population Projections

As noted in the methodology section, it was assumed that crime specific arrests are directly related to demographic factors in an area's population, e.g., age, race, and sex. As such, changes in the age, sex, and racial mix of a population would result in corresponding changes in arrests. Furthermore, the reliability of the arrest projections are heavily dependent on the reliability of the population projection inputs into the model. Hence it is important to examine the changing demographic patterns in the Maryland State population (as projected by the State Department of Planning) as a prelude to an analysis of the arrest projections.

The following set of tables (Tables 1-3) examine both the age and racial distributional changes in Statewide population as well as changes in the age and jurisdictional mix of the population through 1990.

Table 1 is a comparison of Statewide estimated 1975 population to the projected 1980, 1985 and 1990 population respectively by age and race. Included are the percent differences between the years for each of the age and racial groupings. Similar tables comparing the 1975 population by age and race to the 1980, 1985, and 1990 populations by age and race are included in Appendix D for each county and Baltimore City.

Table 2 contains a comparison of the distribution of the age groups for 1975, 1980, 1985, and 1990 for each of the jurisdictional groupings. The numbers in parenthesis are the age group percentages of the total population within the jurisdiction. For example in 1975 in Baltimore City, 211,385 or 24.9% of the total 849,946 population were estimated to be less than or equal to 14 years of age. Similarly, 405,998 or 47.8% of the total 849,946 population were estimated to be 30 years of age or older. The age groupings were chosen to reflect the high crime-prone population, namely the 15-19 and 20-29 year old groupings. As stated previously, changes in the demographic mix of the population appear to be related to changes in arrests. As such, shifts in population within a jurisdiction into or out of the 15-29 year range might be reflected in corresponding increases or decreases in arrests. For example, in Baltimore City, a slight shift in population into the over 30 group is estimated to occur by 1990. In 1975 it is estimated that 47.8% of the total Baltimore City population is over 30 while 52.4% of the total population in Baltimore City is estimated to be 30 years of age or older in 1990.

Table 3 is also a comparison of the 1975 population by age group to the 1980, 1985 and 1990 populations respectively by age group for each of the jurisdictional groupings. Included in this table are the percent increases or decreases in population from 1975. Table 3 should be used in conjunction with Table 2 to gain an overall picture of how the population within a jurisdiction is projected to change (with respect to shifts in distribution across

↓

the age groups and overall increases or decreases in population within the age groups). For example, in addition to the fact that in Baltimore City, more than half of the population is expected to be over 30 by 1990, the total population there is expected to decrease 2.6% by 1990 as compared to 1975 with decreases in the 15-19 and 20-29 population as well. Conversely, in Prince George's County, the distribution of the population with respect to the age groups is projected to remain essentially stable through 1990. However, the overall population there is expected to increase 29.9% by 1990 as compared to 1975 with increases of 32.3% and 27.7% in the 15-19 and 20-29 year old age groupings respectively. Hence, the arrest projection model as developed should project a significant increase in arrests in Prince George's County.

### III. Summary Statewide Arrest Projections

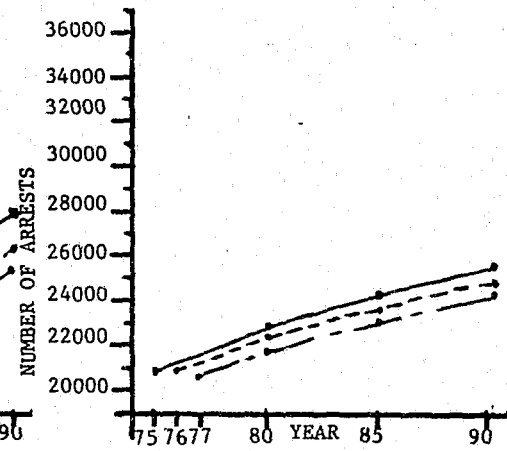

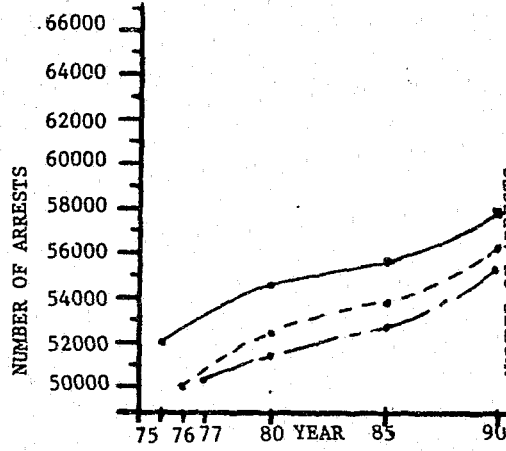

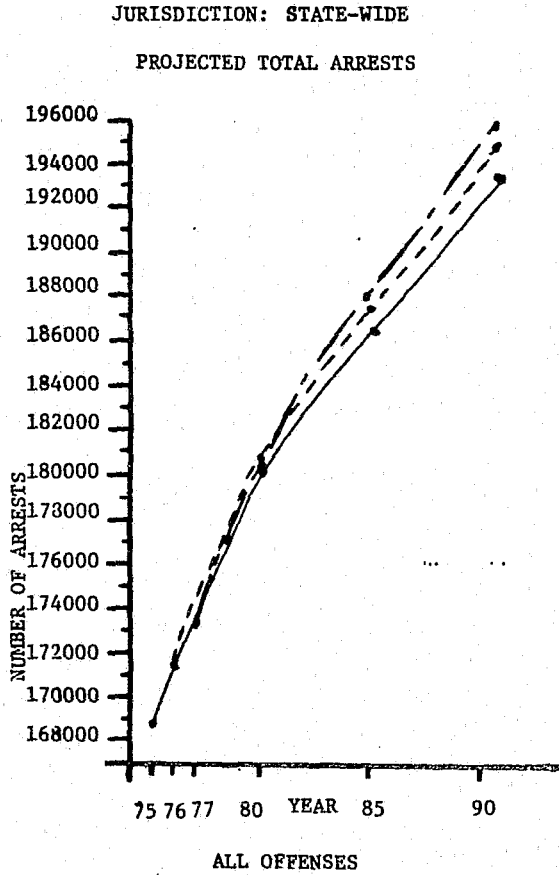

The sets of graphs shown on Figure 2 depict the total Statewide projected volume of arrests for the five crime groupings mentioned previously (i.e., Total Offenses, Part I (less Aggravated Assault), All Assaults (Aggravated and Other), Part II (less Other Assaults and "All Other Offenses") and "All Other Offenses"). In addition, Figure 3 shows separate graphs for the two components of Part I (less Aggravated Assault) projected arrests, namely projected arrests for the Violent Crimes (Criminal Homicide, Forcible Rape, Robbery) and the Property Crimes (Burglary, Larceny, Motor Vehicle Theft). Similar graphs for the total adult projected arrests (Figures 4-5) and total juvenile projected arrests (Figures 6-7) are included in the following sections. Appendix B contains a comparable set of graphs depicting the the adult and juvenile projected arrests for each county and Baltimore City.

For each graph there are three curves corresponding to the arrests generated using the three base years (i.e., 1975, 1976, and 1977) of actual arrest and population data. The graphs should provide a visual indication of any variability in arrests which occurred in the period from 1975-1977, and hence of the stability of the arrest rates through 1975, 1976, and 1977. If the interval separating the three curves is small, then arrest rates for that crime grouping were relatively stable throughout 1975, 1976 and 1977. Assuming this stability continues, the resulting projections would probably be quite reliable.

Care should be taken however before assuming that a wide range in the arrest projections for a particular year and crime type indicates conclusively that the projection will be unreliable. The diversity in arrest rates may also be due to new agencies reporting and changes in agency reporting practices as well as to random reporting differences from year to year. For example, in the graph of arrests for "All Other Offenses" (Figure 2), the arrest projections generated using 1977 as the base year were much higher than those generated using either 1975 or 1976 as the base year. As mentioned previously, in several jurisdictions new agencies began reporting in 1977 with a high percentage of their arrests being reported for the "All Other Offenses" grouping. As such the projections generated using the 1977 data may be the more reliable of the three for this crime type.

VIOLENT CRIMES  
 (Criminal Homicide, Forcible Rape, Robbery)

PROPERTY CRIMES  
 (Burglary, Larceny, Motor Vehicle Theft)

A cursory analysis of the graphs indicates that total Statewide arrests are estimated to increase through 1990, although the rate of increase is estimated to be declining. Arrests for each of the individual crime groupings shown are also estimated to increase. The Part II (less Other Assaults and All Other Offenses) arrests are projected to increase at a faster rate than the Part I (less Aggravated Assault) arrests. In addition, the steeper rate of increase in total arrests when using 1977 as the base year can be attributed to the increase in volume of arrests for the "All Other Offenses" which occurred in 1977 (see Section C.IV.B on adult projection findings).

The estimated increase in Part I (less Aggravated Assault) arrests can be more specifically traced to estimated increases in the Property Crimes of Burglary, Larceny, and Motor Vehicle Theft. The remaining Part I Violent Crimes of Criminal Homicide, Forcible Rape, and Robbery are projected to remain fairly stable over time.

Rather than conduct a more detailed analysis of the total projected arrests, separate interpretations of the juvenile and adult arrest projections are given in the subsequent subsections of this report.

#### IV. Adult Arrest Projections - Statewide and Jurisdictional

##### A. Explanation of Tables and Graphs

The following series of graphs (Figures 4-5) and tables (Tables 4-6) examine changes in adult arrests both Statewide and for the jurisdictional groupings. As with the total Statewide projected arrests (i.e., adult and juvenile combined), each graph contains three curves corresponding to the projections generated using each of the three base years (i.e., 1975, 1976 and 1977) of actual arrest data.

Figure 4 depicts the Statewide projected volume of adult arrests for the following crime groupings: Total Offenses, Part I (less Aggravated Assault), All Assaults (Aggravated and Other), Part II (less Other Assaults and "All Other Offenses"), and "All Other Offenses." Figure 5 contains separate graphs for the two components of Part I (less Aggravated Assault) projected adult arrests: projected arrests for the Violent Crimes (Criminal Homicide, Forcible Rape, Robbery) and the Property Crimes (Burglary, Larceny, Motor Vehicle Theft)

Three types of tables displaying the adult arrest projections are also included. Table 4 is a comparison of adult population and actual reported arrests for 1975, 1976, 1977, and projected adult population and arrests for 1980, 1985 and 1990.\* The table tracks the projected changes in the distribution of adult population and arrests across the jurisdictions. In most instances, changes

---

\*The projected arrests shown in this table are the average of the arrests projected for that year using the three base years of arrest data, 1975, 1976, and 1977.

\*The projected arrests listed here are the average of the arrests projected for that year using the three base years 1975, 1976, and 1977.

NOTE: ( ) = % of State-wide Total.

in the distribution of the adult population across the jurisdictions are reflected in corresponding changes in distribution of the adult arrests across the jurisdictions. For example, as the percentage of the State-wide adult population residing in Baltimore City decreases from an estimated level of 21.1% of the total adult population in 1975 to a projected level of 16.7% in 1990, the percentage of total adult arrests occurring in Baltimore City are projected to decrease from 44.6% of the State-wide total in 1975 to 37.7% of total adult arrests in 1990. While these projected shifts in population and arrests away from Baltimore City might not seem so significant an examination of overall projected shifts in distribution across the jurisdictions could prove beneficial in determining how future resources may need to be allocated.

Table 5 represents a comparative crime type description of actual and projected adult arrests for each jurisdiction. As stated previously, three estimates of a future year's arrests (i.e., 1980, 1985 and 1990) were calculated. The first estimate of the future year's (e.g., 1980) arrests was generated by using 1975 arrest and population data as the base year in the arrest projection model; the second estimate was generated by using 1976 arrest and population data as base year in the model; and the third estimate was generated by using 1977 arrest and population data as base year in the arrest projection model. In Appendix A the arrest projections for 1980, 1985, and 1990 which were generated by using 1975 data as the base year in the model, the projections for 1980, 1985, and 1990 which were generated by using 1976 as the base year in the model, and the 1980, 1985 and 1990 arrest projections generated by using 1977 data as the base year in the arrest projection model are listed separately. Assuming the arrest rates remain fairly stable through 1990 and that the population projections used in the model are reliable, it is not unlikely that the actual volume of a future year's arrests (e.g., 1980) will lie somewhere within the widest interval defined by the three estimates of that year's arrests. Hence, in an effort to provide an estimate of the likely range in volume of a future year's arrests, the low, high and average volume for each future year's (i.e., 1980, 1985 and 1990) arrest projections are listed in Table 5.

The low value for a future year's (e.g., 1980) arrests is simply the lowest of the three estimates generated for that year; the high value of the future year's arrests is the highest of the three estimates generated for that year; the average value is the average of these three estimates. For example, when using 1975 as the base year in the model it is estimated that 52,240 adult arrests will occur in Baltimore City in 1980. If 1976 is used as base year in the model 49,447 adult arrests are projected to occur in Baltimore City in 1980, while 48,570 adult arrests are projected to occur in Baltimore City in 1980 if 1977 data is used as the base year in the model. Hence the low estimate of the 1980 projected adult arrests in Baltimore City is 48,570, the high estimate is 52,240 and the average estimate is 50,086. The average number of projected arrests is calculated by adding the three estimates of the 1980 arrests in Baltimore City and dividing by three. That is the 1980 average estimate =  $\frac{52,240 + 49,447 + 48,570}{3} = 50,086$ .

3

In addition, the percentage of the total State-wide adult arrests projected to occur within each jurisdiction are shown. Again, the percentage information is included so that the projected changes in the distribution of adult arrests can be examined.

\*The low estimate of a future year's arrests for a district consisting of one or more counties is determined as explained in the narrative. That is, arrests are projected using 1975 data, 1976 data, and 1977 data and the lowest of these three estimates is chosen. The low estimate of the State-wide arrests for that future year is then determined by summing the low estimates that are listed for each district. Similarly, the high estimate of a future year's arrests for a district consisting of one or more counties is determined by choosing the highest of the three values estimated for that future year (i.e., the highest of the three arrest projections generated for that future year by using 1975, 1976 and 1977 data). The high estimate of the State-wide arrests is then determined by summing the high estimates that are listed for each district.

NOTE: ( ) = % of State Total.

That is, arrests are projected using 1975 data, 1976 data, and 1977 data and the lowest of these three estimates is chosen. The low estimate of the State-wide arrests for that future year is then determined by summing the low estimates that are listed for each district. Similarly, the high estimate of a future year's arrests for a district consisting of one or more counties is determined by choosing the highest of the three values estimated for that future year (i.e., the highest of the three arrest projections generated for that future year by using 1975, 1976 and 1977 data). The high estimate of the State-wide arrests is then determined by summing the high estimates that are listed for each district.

NOTE: ( ) = % of State Total.

\*The low estimate of a future year's arrests for a district consisting of one or more counties is determined as explained in the narrative. That is, arrests are projected using 1975 data, 1976 data, and 1977 data and the lowest of these three estimates is chosen. The low estimate of the State-wide arrests for that future year is then determined by summing the low estimates that are listed for each district. Similarly, the high estimate of a future year's arrests for a district consisting of one or more counties is determined by choosing the highest of the three values estimated for that future year (i.e., the highest of the three arrest projections generated for that future year by using 1975, 1976 and 1977 data). The high estimate of the State-wide arrests is then determined by summing the high estimates that are listed for each district.

NOTE: ( ) = % of State Total.

\*The low estimate of a future year's arrests for a district consisting of one or more counties is determined as explained in the narrative. That is, arrests are projected using 1975 data, 1976 data, and 1977 data and the lowest of these three estimates is chosen. The low estimate of the State-wide arrests for that future year is then determined by summing the low estimates that are listed for each district. Similarly, the high estimate of a future year's arrests for a district consisting of one or more counties is determined by choosing the highest of the three values estimated for that future year (i.e., the highest of the three arrest projections generated for that future year by using 1975, 1976 and 1977 data). The high estimate of the State-wide arrests is then determined by summing the high estimates that are listed for each district.

NOTE: ( ) = % of State Total.

Finally, Table 6 compares the 1977 actual arrests and projected arrests for 1980, 1985 and 1990 for each of the five crime types and 12 jurisdictional groupings. For the years 1980, 1985 and 1990 the average of the three projected values for that year using the three base years of data (i.e., 1975, 1976 and 1977) is shown. Also included is the projected percent increase or decrease in arrests from 1977 to the future year. For example, adult arrests Statewide are projected to increase 6.3% by 1980 over the number of adult arrests which occurred in 1977. Similarly, an increase of 13.8% is projected to occur by 1985, and by 1990 adult arrests are projected to increase 19.8%.

The material presented in this section has been aggregated for the jurisdictional groupings and crime types as explained previously. Once again, it should be noted that a complete set of arrest projections by county as well as corresponding graphs by county are included in Appendices A and B respectively.

#### B. Interpretation of Adult Arrest Projections

Statewide total adult arrests are projected to increase through 1990, although the rate of increase is estimated to be declining. This increase corresponds to the projected increase in Statewide population, as evidenced by the following chart:

|                                                       | <u>1977-</u><br><u>1980</u> | <u>1977-</u><br><u>1985</u> | <u>1977-</u><br><u>1990</u> |
|-------------------------------------------------------|-----------------------------|-----------------------------|-----------------------------|
| Statewide<br>Adult Population Projections<br>% Change | +6.0%                       | +15.5%                      | +25.4%                      |
| Statewide<br>Adult Arrest Projections<br>% Change     | +6.3%                       | +13.8%                      | +19.8%                      |

In addition, an analysis of the graphs (Figures 2 and 3) of the individual crime types indicates the following general trends:

1. Arrests for each of the crime types considered (i.e., Part I (less Aggravated Assault) All Assaults, Part II (less Other Assaults and All Other Offenses) and "All Other Offenses" are estimated to increase when using each of 1975, 1976 and 1977 as the base year. However, Part II (less Other Assaults and All Other Offenses) arrests are estimated to increase at a faster rate, and one which more nearly approximates the total increase for all adult arrests.
2. The steeper rise in total adult arrests when using the 1977 data as the base year can be explained in large part by the greater volume of reported arrests for the "All Other Offenses" as reported for 1977. This is due in large part to the initiation of arrest reporting

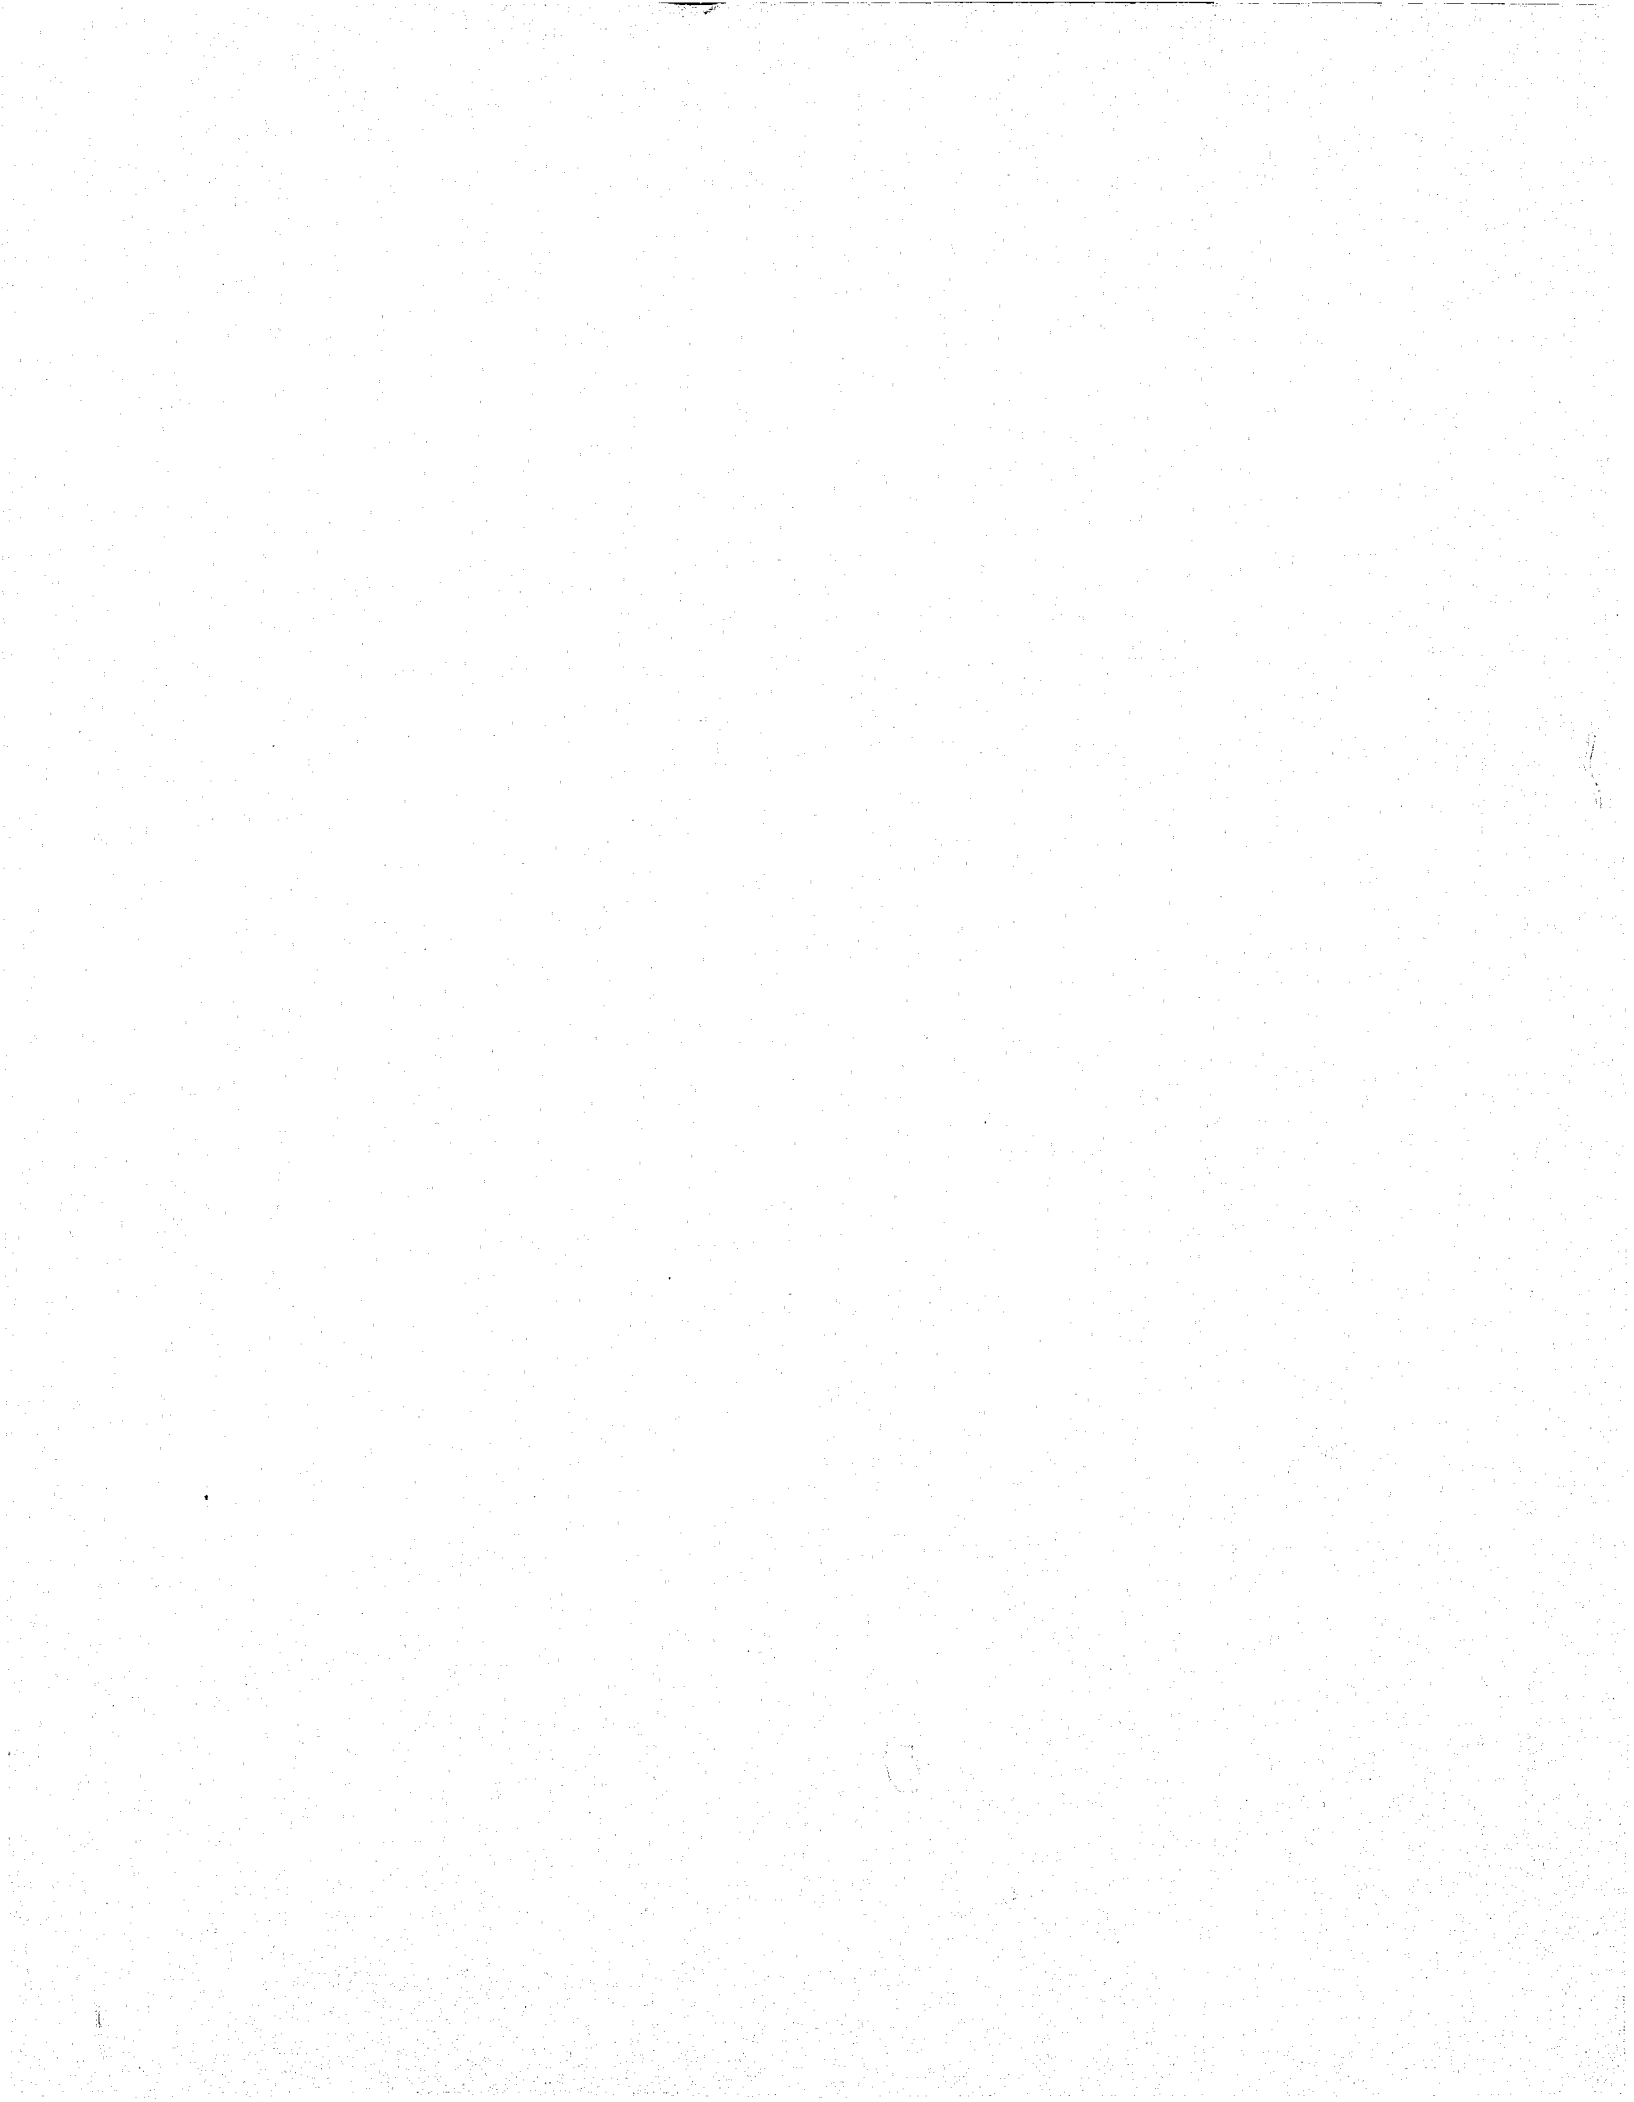

TABLE 6: ACTUAL 1977 ARRESTS AND PROJECTED 1980, 1985,  
AND 1990 ARRESTS AND PERCENT CHANGE FROM 1977

| STATE-WIDE                                           | 23783                     | 20615                                   | -13.3                    | 23783                     | 22366                                   | -6.0                     | 23783                     | 23770                                   | -.1                      |

by several agencies who had not reported in previous years. The Prince George's County Sheriff's Office did not begin reporting until 1977 with most of their reported adult arrests in the "All Other Offenses" category. Similar occurrences of new or expanded reporting were noted in other counties, e.g., Washington County where new agency reporting contributed to the increase in "All Other Offenses" in 1977 when compared to 1975 and 1976.

The remaining analysis is conducted with respect to the average projected future arrests. In addition, rather than examine each of the individual jurisdictional groupings estimated changes in arrests, only the five top ranked jurisdictions in terms of volume of arrests and size of population will be considered. These jurisdictions account for approximately 75% of the total State-wide volume of arrests and population. As such, an analysis of changing patterns in their population and arrests should prove useful in helping to explain Statewide changes.

Consider the following four sets of charts comparing adult population (estimated and projected), and adult arrests (actual and projected), in each of the five top ranked jurisdictions for 1977, 1980, 1985, and 1990. The rankings as noted need not be the same for population size and volume of arrests. The numbers in parantheses indicate the percentage (%) of the total Statewide (actual or projected) volume of adult population and adult arrests respectively. Hence in 1977 these five jurisdictions accounted for approximately 75.0% of the total Statewide adult population and approximately 78.6% of the total Statewide reported adult arrests.

Estimated Adult Population - 1977

|                    | Estimated<br>Population | % of<br>Statewide<br>Total |
|--------------------|-------------------------|----------------------------|
| 1. Baltimore City  | 591,083                 | (20.4)                     |
| 2. Baltimore       | 477,959                 | (16.5)                     |

Projected Arrests - 1990

|                    | <u>Projected<br/>Arrests*</u> | <u>% of<br/>Statewide<br/>Total</u> |
|--------------------|-------------------------------|-------------------------------------|
| 1. Baltimore City  | 51,893                        | (37.7)                              |
| 2. Prince George's | 19,519                        | (14.2)                              |
| 3. Anne Arundel    | 12,519                        | ( 9.1)                              |
| 4. Baltimore       | 11,899                        | ( 8.6)                              |
| 5. Montgomery      | 11,078                        | ( 8.0)                              |
|                    |                               | <u>77.6%</u>                        |

An analysis of the rankings of these jurisdictions across the years indicates how changes in the population induce changes in projected arrests. Similarly, comparing the rankings of the jurisdictions in terms of population versus arrests in any particular year as well as comparing the corresponding distributions will indicate the influence of other factors in the demographic mix of an area's population (as accounted for by the arrest projection model) in determining the projected arrests.

The major projected distributional changes in population among the five jurisdictions between 1977 and 1990 occur in Baltimore City and Anne Arundel County. While the proportion of adult population is expected to shift away from Baltimore City, Anne Arundel County is expected to have a rise in the proportion of adult population. Correspondingly while 40.5% of adult arrests occurred in Baltimore City in 1977, only 37.7% are estimated to occur there in 1990; in 1977, 7.8% of total adult arrests took place in Anne Arundel County while 9.1% of the total Statewide arrests are estimated to occur there in 1990. In fact, by 1990 adult arrests in Anne Arundel County are projected to exceed those in Baltimore County.

A comparison of the projected rankings of the jurisdictions in terms of population and the rankings in terms of arrests in 1990 indicates the following: while the population is fairly evenly distributed among the first four jurisdictions, with a projected high of 16.8% of the adult population residing in Baltimore County down to a projected 14.6% residing in Montgomery County, adult arrests

\*The projected arrests listed here are the average of the arrests projected for that year using the three base years 1975, 1976 and 1977.

are not so evenly distributed. Thirty-seven and seven-tenths percent (37.7%) of total adult arrests are estimated to occur in Baltimore City while only 8.6% are estimated to occur in Baltimore County despite the fact that the two jurisdictions are projected to have about the same percent of the total State-wide adult population. Evidently, as noted previously, other factors besides the size of the adult population (accounted for in the model by the arrest rates) contribute to the volume of arrests for a jurisdiction.

Finally, some consideration should be given to the graphical displays of projected arrests (see Appendix B) for these five jurisdictions. Baltimore City adult arrests are projected to stabilize after 1980 corresponding to the shift in adult population away from Baltimore City. In Baltimore County, the estimated arrests seem to be stabilizing after 1985. In Prince George's, Montgomery, and Anne Arundel Counties however, the increase in adult arrests is greater and a stabilization is not immediately evident. Since by 1990, 31.3% of all adult arrests are predicted to occur in these three counties (i.e., Prince George's, Montgomery and Anne Arundel) it is not surprising that total State-wide adult arrests are not stabilizing at a faster rate (as in Baltimore City).

Below and on the next page, the Part I (less Aggravated Assault) and Part II (less Other Assaults and "All Other Offenses") arrest projections are examined. Together arrests for these crime types (i.e., Criminal Homicide, Forcible Rape, Robbery, Burglary, Larceny, Motor Vehicle Theft, and Part II (less Other Assaults and All Other Offenses)), represent close to 70% of the total State-wide adult arrests. As above, only the five top ranked jurisdictions in terms of size of population and volume of arrests will be considered.

As stated previously, Part I (less Aggravated Assault) adult arrests are projected to increase through 1990, although not at a dramatic rate. More specifically, as the graph of Violent vs. Property Crimes (Figure 5) (the two components of Part I (less Aggravated Assault)) indicates it is the Property Crimes of Burglary, Larceny and Motor Vehicle Theft that are mainly responsible for this occurrence. Adult arrests for the Violent Crimes of Criminal Homicide, Forcible Rape and Robbery are projected to remain more stable over time.

For Part I (less Aggravated Assault) offenses, the following distribution of arrests occurred in 1977 and is projected to occur in 1980, 1985 and 1990 respectively. The numbers in parentheses indicate the percent (%) of the total Statewide (actual or projected) adult arrests for the Part I (less Aggravated Assault) offenses.

| 3. Baltimore                                                            | 3,473          | (14.0)               | 3. Baltimore                                                     | 3,548              | (12.9)               |
| 4. Montgomery                                                           | 2,289          | ( 9.2)               | 4. Montgomery                                                    | 2,497              | ( 9.1)               |
| 5. Anne Arundel                                                         | 1,576          | ( 6.4)               | 5. Anne Arundel                                                  | 1,769              | ( 6.4)               |
|                                                                         |                | 83.3%                |                                                                  |                    | 82.6%                |

\*The projected arrests shown in this table are the average of the arrests projected for that year using the three base years 1975, 1976 and 1977.

Projected Part I (less Aggravated Assault) Arrests - 1985

|                    | Projected Arrests* | % of Statewide Total |
|--------------------|--------------------|----------------------|
| 1. Baltimore City  | 10,238             | (34.6)               |
| 2. Prince George's | 5,793              | (19.6)               |
| 3. Baltimore       | 3,668              | (12.4)               |
| 4. Montgomery      | 2,758              | ( 9.3)               |
| 5. Anne Arundel    | 1,930              | ( 6.5)               |
|                    |                    | <u>82.4</u>          |

Projected Part I (less Aggravated Assault) Arrests - 1990

|                    | Projected Arrests* | % of Statewide Total |
|--------------------|--------------------|----------------------|
| 1. Baltimore City  | 10,290             | (32.9)               |
| 2. Prince George's | 6,912              | (22.1)               |
| 3. Baltimore       | 3,686              | (11.8)               |
| 4. Montgomery      | 3,078              | ( 9.8)               |
| 5. Anne Arundel    | 2,053              | ( 6.6)               |
|                    |                    | <u>83.2%</u>         |

Here the rankings of the jurisdiction in terms of projected arrests seem to more closely track the rankings of the counties in terms of projected population, except for Baltimore County. In addition, the gap in volume of arrests between Baltimore City and Prince George's County is projected to decrease more quickly than when the total arrests were examined.

For the Part II (less Other Assaults and All Other Offenses) crime grouping the following distribution of arrests occurred in 1977 and is projected to occur in 1980, 1985 and 1990 respectively. The numbers in parantheses indicate the percentage (%) of the total Statewide(actual or projected) volume of adult arrests for the Part II (less Other Assaults and All Other Offenses) crime grouping.

Actual Part II (less Other Assaults and All Other Offenses) Arrests - 1977

|                    | Actual Arrests | % of Statewide Total |
|--------------------|----------------|----------------------|
| 1. Baltimore City  | 23,173         | (46.3)               |
| 2. Baltimore       | 4,606          | ( 9.2)               |
| 3. Anne Arundel    | 4,595          | ( 9.2)               |
| 4. Prince George's | 4,242          | ( 8.5)               |
| 5. Montgomery      | 3,354          | ( 6.7)               |
|                    |                | <u>79.9%</u>         |

Projected Part II (less Other Assaults and All Other Offenses) Arrests - 1980

|                    | Projected Arrests* | % of Statewide Total |
|--------------------|--------------------|----------------------|
| 1. Baltimore City  | 26,309             | (46.8)               |
| 2. Anne Arundel    | 5,230              | ( 9.3)               |
| 3. Prince George's | 4,819              | ( 8.6)               |
| 4. Baltimore       | 4,646              | ( 8.3)               |
| 5. Montgomery      | 3,880              | ( 6.9)               |
|                    |                    | <u>79.9%</u>         |

Projected Part II (less Other Assaults and All Other Offenses) Arrests-1985

|                    | Projected Arrests* | % of Statewide Total |
|--------------------|--------------------|----------------------|
| 1. Baltimore City  | 26,773             | (44.9)               |
| 2. Anne Arundel    | 5,872              | ( 9.8)               |
| 3. Prince George's | 5,516              | ( 9.2)               |
| 4. Baltimore       | 4,846              | ( 8.1)               |
| 5. Montgomery      | 4,138              | ( 6.9)               |
|                    |                    | <u>78.9%</u>         |

Projected Part II (less Other Assaults and All Other Offenses) Arrest-1990

|                    | Projected Arrests* | % of Statewide Total |
|--------------------|--------------------|----------------------|
| 1. Baltimore City  | 27,203             | (43.7)               |
| 2. Anne Arundel    | 6,408              | (10.3)               |
| 3. Prince George's | 6,332              | (10.2)               |
| 4. Baltimore       | 4,866              | ( 7.8)               |
| 5. Montgomery      | 4,409              | ( 7.1)               |
|                    |                    | <u>79.1%</u>         |

\*The projected arrests shown in this table are the average of the arrests projected for that year using the three base years 1975, 1976 and 1977.

In summary, it should be noted that the preceding analysis is based on a comparison among the jurisdictions of the "average" number of adult arrests projected for that year (i.e., 1980, 1985, or 1990) using the three projected adult arrest values derived from the three base year (1975, 1976 and 1977) projections. This analysis would vary somewhat if something other than the "average" number of projected adult arrests was used (for example, the highest number of adult arrests for the projected year regardless of the base year that generated that projected number of arrests). For this reason, the conclusions drawn serve largely to illustrate the type of comparison across the jurisdictions that can be performed using the adult arrest projection data.

## V. Juvenile Arrest Projections - Statewide and Jurisdictional

### A. Explanation of Tables and Graphs

The following series of graphs (Figures 6 and 7) and tables (Tables 7-9) examine changes in juvenile arrests both Statewide and for the jurisdictional groupings (i.e., District Court districts). The information is organized comparable to the adult section. As in the adult section, each graph contains three curves corresponding to the projections generated using each of the three base years (i.e., 1975, 1976 and 1977) of actual arrest and population data. Figure 6 depicts the projected Statewide volume of juvenile arrests for the following crime groupings: Total Offenses, Part I (less Aggravated Assault), All Assaults (Aggravated and Other), Part II (less Other Assaults and All Other Offenses), and All Other Offenses. Figure 7 contains graphs of the projected volume of juvenile arrests for the Part I Violent Crime grouping (Criminal Homicide, Forcible Rape, Robbery) and the Part I offense Property Crime grouping (Burglary, Larceny, Motor Vehicle Theft).

Table 7 is a comparison of the juvenile population and actual arrests for 1975, 1976, and 1977 and projected arrests for 1980, 1985 and 1990. As in the corresponding table in the adult section, the table tracks the projected changes in the distribution of population and arrests across the jurisdictions.

Table 8 represents a comparative crime type description of actual and projected juvenile arrests for each jurisdictional grouping. Listed are the low, high and average values of the projections for each crime type for a given jurisdictional grouping. Additionally, the percentages of total Statewide juvenile arrests projected to occur within each jurisdictional grouping are shown.

Table 9 compares the 1977 actual juvenile arrests and projected juvenile arrests for 1980, 1985 and 1990 for each of the five crime types and 12 jurisdictional groupings. Included is the projected percent increase or decrease in juvenile arrests from 1977 to the future year. For example, Statewide juvenile arrests are projected to decrease 1.1% between 1977 and 1980, decrease 4.3% between 1977 and 1985, and decrease 2.9% between 1977 and 1990.

### B. Interpretation of Juvenile Arrest Projections

State-wide total juvenile arrests are projected to decrease through 1985 after which they are projected to increase again at least through 1990. However, the volume of arrests in 1990 is still projected to be lower than the volume in 1977. Several factors appear to be responsible for these projected trends. These factors can best be illustrated through the use of a series of charts which compare the larger jurisdictions in terms of the size of the juvenile population and the number of juvenile arrests.

\*The low estimate of a future year's arrests for a district consisting of one or more counties is determined as explained in the narrative. That is, arrests are projected using 1975 data, 1976 data, and 1977 data and the lowest of these three estimates is chosen. The low estimate of the State-wide arrests for that future year is then determined by summing the low estimates that are listed for each district. Similarly, the high estimate of a future year's arrests for a district consisting of one or more counties is determined by choosing the highest of the three values estimated for that future year (i.e., the highest of the three arrest projections generated for that future year by using 1975, 1976 and 1977 data). The high estimate of the State-wide arrests is then determined by summing the high estimates that are listed for each district.

\*The low estimate of a future year's arrests for a district consisting of one or more counties is determined as explained in the narrative. That is, arrests are projected using 1975 data, 1976 data, and 1977 data and the lowest of these three estimates is chosen. The low estimate of the State-wide arrests for that future year is then determined by summing the low estimates that are listed for each district. Similarly, the high estimate of a future year's arrests for a district consisting of one or more counties is determined by choosing the highest of the three values estimated for that future year (i.e., the highest of the three arrest projections generated for that future year by using 1975, 1976 and 1977 data). The high estimate of the State-wide arrests is then determined by summing the high estimates that are listed for each district.

Below is the 1977 comparison of the distribution of the five top ranked jurisdictions in terms of size of the juvenile population and volume of juvenile arrests.

| <u>Estimated Juvenile Population-1977</u> |                      |                      | <u>Actual Juvenile Arrests-1977</u> |                |                      |
|-------------------------------------------|----------------------|----------------------|-------------------------------------|----------------|----------------------|
|                                           | Estimated Population | % of Statewide Total |                                     | Actual Arrests | % of Statewide Total |
| 1. Prince George's                        | 262,677              | (19.8)               | 1. Baltimore City                   | 20,266         | (34.5)               |
| 2. Baltimore City                         | 250,411              | (18.9)               | 2. Prince George's                  | 12,051         | (20.5)               |
| 3. Montgomery                             | 183,982              | (13.9)               | 3. Baltimore                        | 6,824          | (11.6)               |
| 4. Baltimore                              | 175,858              | (13.3)               | 4. Montgomery                       | 5,209          | ( 8.9)               |
| 5. Anne Arundel                           | 120,120              | ( 9.1)               | 5. Anne Arundel                     | 3,979          | ( 6.8)               |
|                                           |                      | <u>75.0%</u>         |                                     |                | <u>82.3%</u>         |

The numbers in parentheses indicate the percentage (%) of the total Statewide volume of juvenile population and arrests respectively. In 1977 these five jurisdictions accounted for approximately 75% of the total Statewide juvenile population and 82.3 of the total Statewide juvenile arrests. Note that while the juvenile population in Baltimore City is lower than that in Prince George's County, the volume of juvenile arrests in Baltimore City is nonetheless higher. Since volume of arrests in an area is influenced by other factors besides size of the population this is not unexpected. Now consider the following three sets of charts using the 1980, 1985 and 1990 projections in place of 1977 actual data.

| <u>Projected Juvenile Population-1980</u> |                      |                      | <u>Projected Juvenile Arrests-1980</u> |                    |                      |

|                                           |                      | <u>74.8%</u>         |                                        |                    | <u>83.3%</u>         |

\*The projected arrests listed here are the average of the arrests projected for that year using the three base years 1975, 1976 and 1977.

Note that the jurisdiction rankings in each of these three sets of charts correspond to the respective rankings using the 1977 data. However, shifts in population distribution and volume of arrests are estimated or projected to occur. In 1977, 19.8% of the total Statewide juvenile population resided in Prince George's County and 18.9% in Baltimore City. By 1990, 22.4% of the State's juveniles are projected to reside in Prince George's County and 16.2% in Baltimore City. An examination of the arrest data evidences similar occurrences. In 1977, Baltimore City juveniles accounted for 34.5% of total Statewide arrests and Prince George's County 20.5% while in 1990 31.1% of the Statewide juvenile arrests are projected to occur in Baltimore City and 25.2% in Prince George's County.

The remaining analysis will be confined to the Part I (less Aggravated Assault) and Part II (less All Other Offenses and Other Assaults) offenses. These crime groupings together account for approximately 75% of total juvenile arrests. As such, an analysis of these crime types individually will provide more insight into factors contributing to the projected Statewide juvenile arrest totals. In addition, together they provide a more reliable indicator of the nature of future juvenile arrests since the more erratic crime types in terms of changing volume of arrests (i.e., All Assaults and All Other Offenses) have been excluded. As above, only the top five ranked jurisdictions in terms of projected volume of arrests are considered.

For Part I (less Aggravated Assault) offenses, the following distribution of arrests has occurred in 1977 and is projected to occur in 1980, 1985 and 1990 respectively. The numbers in parantheses indicate the percentage of the Statewide (actual or projected) juvenile arrests for the Part I (less Aggravated Assault) crime grouping.

| 1. Baltimore City                                                        | 8,469              | (34.3)               | 1. Baltimore City                                                        | 8,321              | (32.7)               |
| 2. Prince George's                                                       | 5,885              | (23.8)               | 2. Prince George's                                                       | 6,639              | (26.1)               |
| 3. Baltimore                                                             | 2,690              | (10.9)               | 3. Baltimore                                                             | 2,640              | (10.4)               |
| 4. Montgomery                                                            | 2,310              | ( 9.4)               | 4. Montgomery                                                            | 2,424              | ( 9.5)               |
| 5. Anne Arundel                                                          | 1,539              | ( 6.2)               | 5. Anne Arundel                                                          | 1,644              | ( 6.5)               |
|                                                                          |                    | 84.6%                |                                                                          |                    | 85.2%                |

Here, too, the gap in the volume of arrests between Baltimore City and Prince George's County is predicted to decrease over time. This corresponds to the

\*The projected arrests listed here are the average of the arrests projected for that year using the three base years 1975, 1976, and 1977.

estimated increase in juvenile population in Prince George's County and predicted decrease in Baltimore City. In addition, the juvenile arrests for Part I (less Aggravated Assault) crimes are projected to decrease through 1985 after which they will begin to increase through 1990, analogously to total juvenile arrests. More specifically as the graph of Violent Crimes vs. Property Crimes (Figure 7) indicates, it is the Property Crimes of Burglary, Larceny, and Motor Vehicle Theft that are mainly responsible for this projected trend. Arrests for the Violent Crimes of Criminal Homicide, Forcible Rape and Robbery are projected to remain more stable over time.

The distribution of arrests for the Part II (less All Other Offenses and Other Assaults) crimes is estimated to behave in the following manner. The numbers in parantheses indicate the percentage of the Statewide (actual or projected) juvenile arrests for the Part II (less Other Assaults and All Other Offenses) crime grouping.

| <u>Actual Part II (less Other Assaults and Other Offenses) Arrests-1977</u> |                |                 | <u>Projected Part II (less Other Assaults and All Other Offenses) Arrests-1980</u> |                    |                 |

| 4. Baltimore                                                    | 1,908              | ( 9.8)          | 4. Baltimore                                                                       | 1,742              | ( 8.9)          |
| 5. Anne Arundel                                                 | 1,561              | ( 8.0)          | 5. Anne Arundel                                                                    | 1,667              | ( 8.6)          |
|                                                                 |                    | 78.9%           |                                                                                    |                    | 79.1%           |

For this crime grouping, the shift in volume of arrests between Baltimore City and Prince George's County is not so dramatic as for the Part I (less Aggravated Assault) crimes. On the other hand, Baltimore County and Anne Arundel County are projected to behave more nearly alike in the future; that is, the volume of arrests for these two counties are projected to be almost equal by 1990.

\*The projected arrests listed here are the average of the arrests projected for that year using the three base years 1975, 1976 and 1977.

In summary, it should be noted that the preceding analysis is based on a comparison among the jurisdictions of the "average" number of juvenile arrests projected for that year (i.e., 1980, 1985, or 1990) using the three projected juvenile arrest values derived from the three base years (1975, 1976 and 1977) projections. This analysis would vary somewhat if something other than the "average" number of projected juvenile arrests was used (for example, the highest number of juvenile arrests for the projected year regardless of the base year that generated that projected number of arrests). For this reason, the conclusions drawn serve largely to illustrate the type of comparison across the jurisdictions that can be performed using the juvenile arrest projection data.

## SECTION D: SUMMARY

It is important to stress once again that the reliability of the arrest projections and hence the validity of the interpretation just presented is heavily dependent on three factors: 1) the reliability of the underlying assumption that the arrest rates remain constant over time (at least through 1990); 2) the reliability of the arrest data used; and 3) the reliability of the population estimates and projections used as input to the model.

The importance of the arrest rates in estimating future arrests was noted in the report. It was pointed out that the rankings of the jurisdictions in terms of volume of arrests differed to some extent from the rankings of the jurisdictions in terms of the size of the population. This indicates that other factors besides the size of a jurisdiction's population such as the demographic mix of the population (as accounted for by the arrest rates used in the model) influence arrests. The arrest rates used in the model directly or indirectly incorporate population, age, sex, race and density as factors which are numerically related to arrests for a jurisdiction. Since it was assumed that the arrest rates calculated for the base years 1975, 1976, and 1977 will remain constant, should extreme changes occur within a jurisdiction that subsequently affect the arrest rates, then the projections in this report will be more limited in their long range utility.

As stated in the methodology section, some flexibility in deviating from the constant arrest rate assumption (e.g., allowing that factors influencing arrests might not be completely constant and allowing for random, or not so random fluctuations in the arrest data) were included in the arrest projection model. This was done by using each of CY 1975, CY 1976 and CY 1977 arrest data as input to the model to generate the three estimates of each future year's (e.g., 1980, 1985, 1990) arrests. While the previous interpretation of the arrests was conducted with respect to the average projection for a particular crime grouping (i.e., the average of the three projections generated by using each of 1975, 1976 and 1977 data), the respective low and high value of the projections for each crime type and jurisdiction were also included. The resulting range for each projection can provide some indication of the reliability of the projection. For example, as noted in the graph of total State-wide adult arrests, the three curves track each other fairly closely, being almost superimposed through 1980. As a result, the range of the total adult arrests projected for the future years 1980, 1985 and 1990 is fairly small. This is indicative of fairly constant adult arrest rates throughout 1975, 1976 and 1977.

Care should be taken however before assuming that a wide range in the arrest projections indicates that the projection will be unreliable. Consider the graph (Figure 2) of projected adult arrests for All Other Offenses. Here there is a wide range between the projections generated using 1977 as the base year versus using 1975 or 1976 as the base year. This difference, however, is due mainly to new agencies reporting in CY 1977 and as such the projections generated using the 1977 data are probably the more reliable estimate of future arrests for this crime grouping.

Finally, the importance of the population projections in determining the reliability of the arrest projections should be stressed. Again it should be noted that if the population projections prove unreliable then the arrest projections will in turn be questionable. As explained in the methodology section, the population projection method is based on three components, estimating the number of births, deaths, and net migration within an area in a specified interval of time. Estimation of the number of births and net migration prove the most difficult since these two factors are more subject to changing circumstances in population. Projected births may be more subject to changes in an area's population resulting from new attitudes toward birth control and family size, etc., which cannot be fully anticipated at this time. However, assuming the net migration estimates prove reliable then at a minimum the adult population projections should prove adequate (at least for the larger jurisdictions) since the 1980 and 1985 and to a large extent the 1990 adult population were counted in the 1970 census.

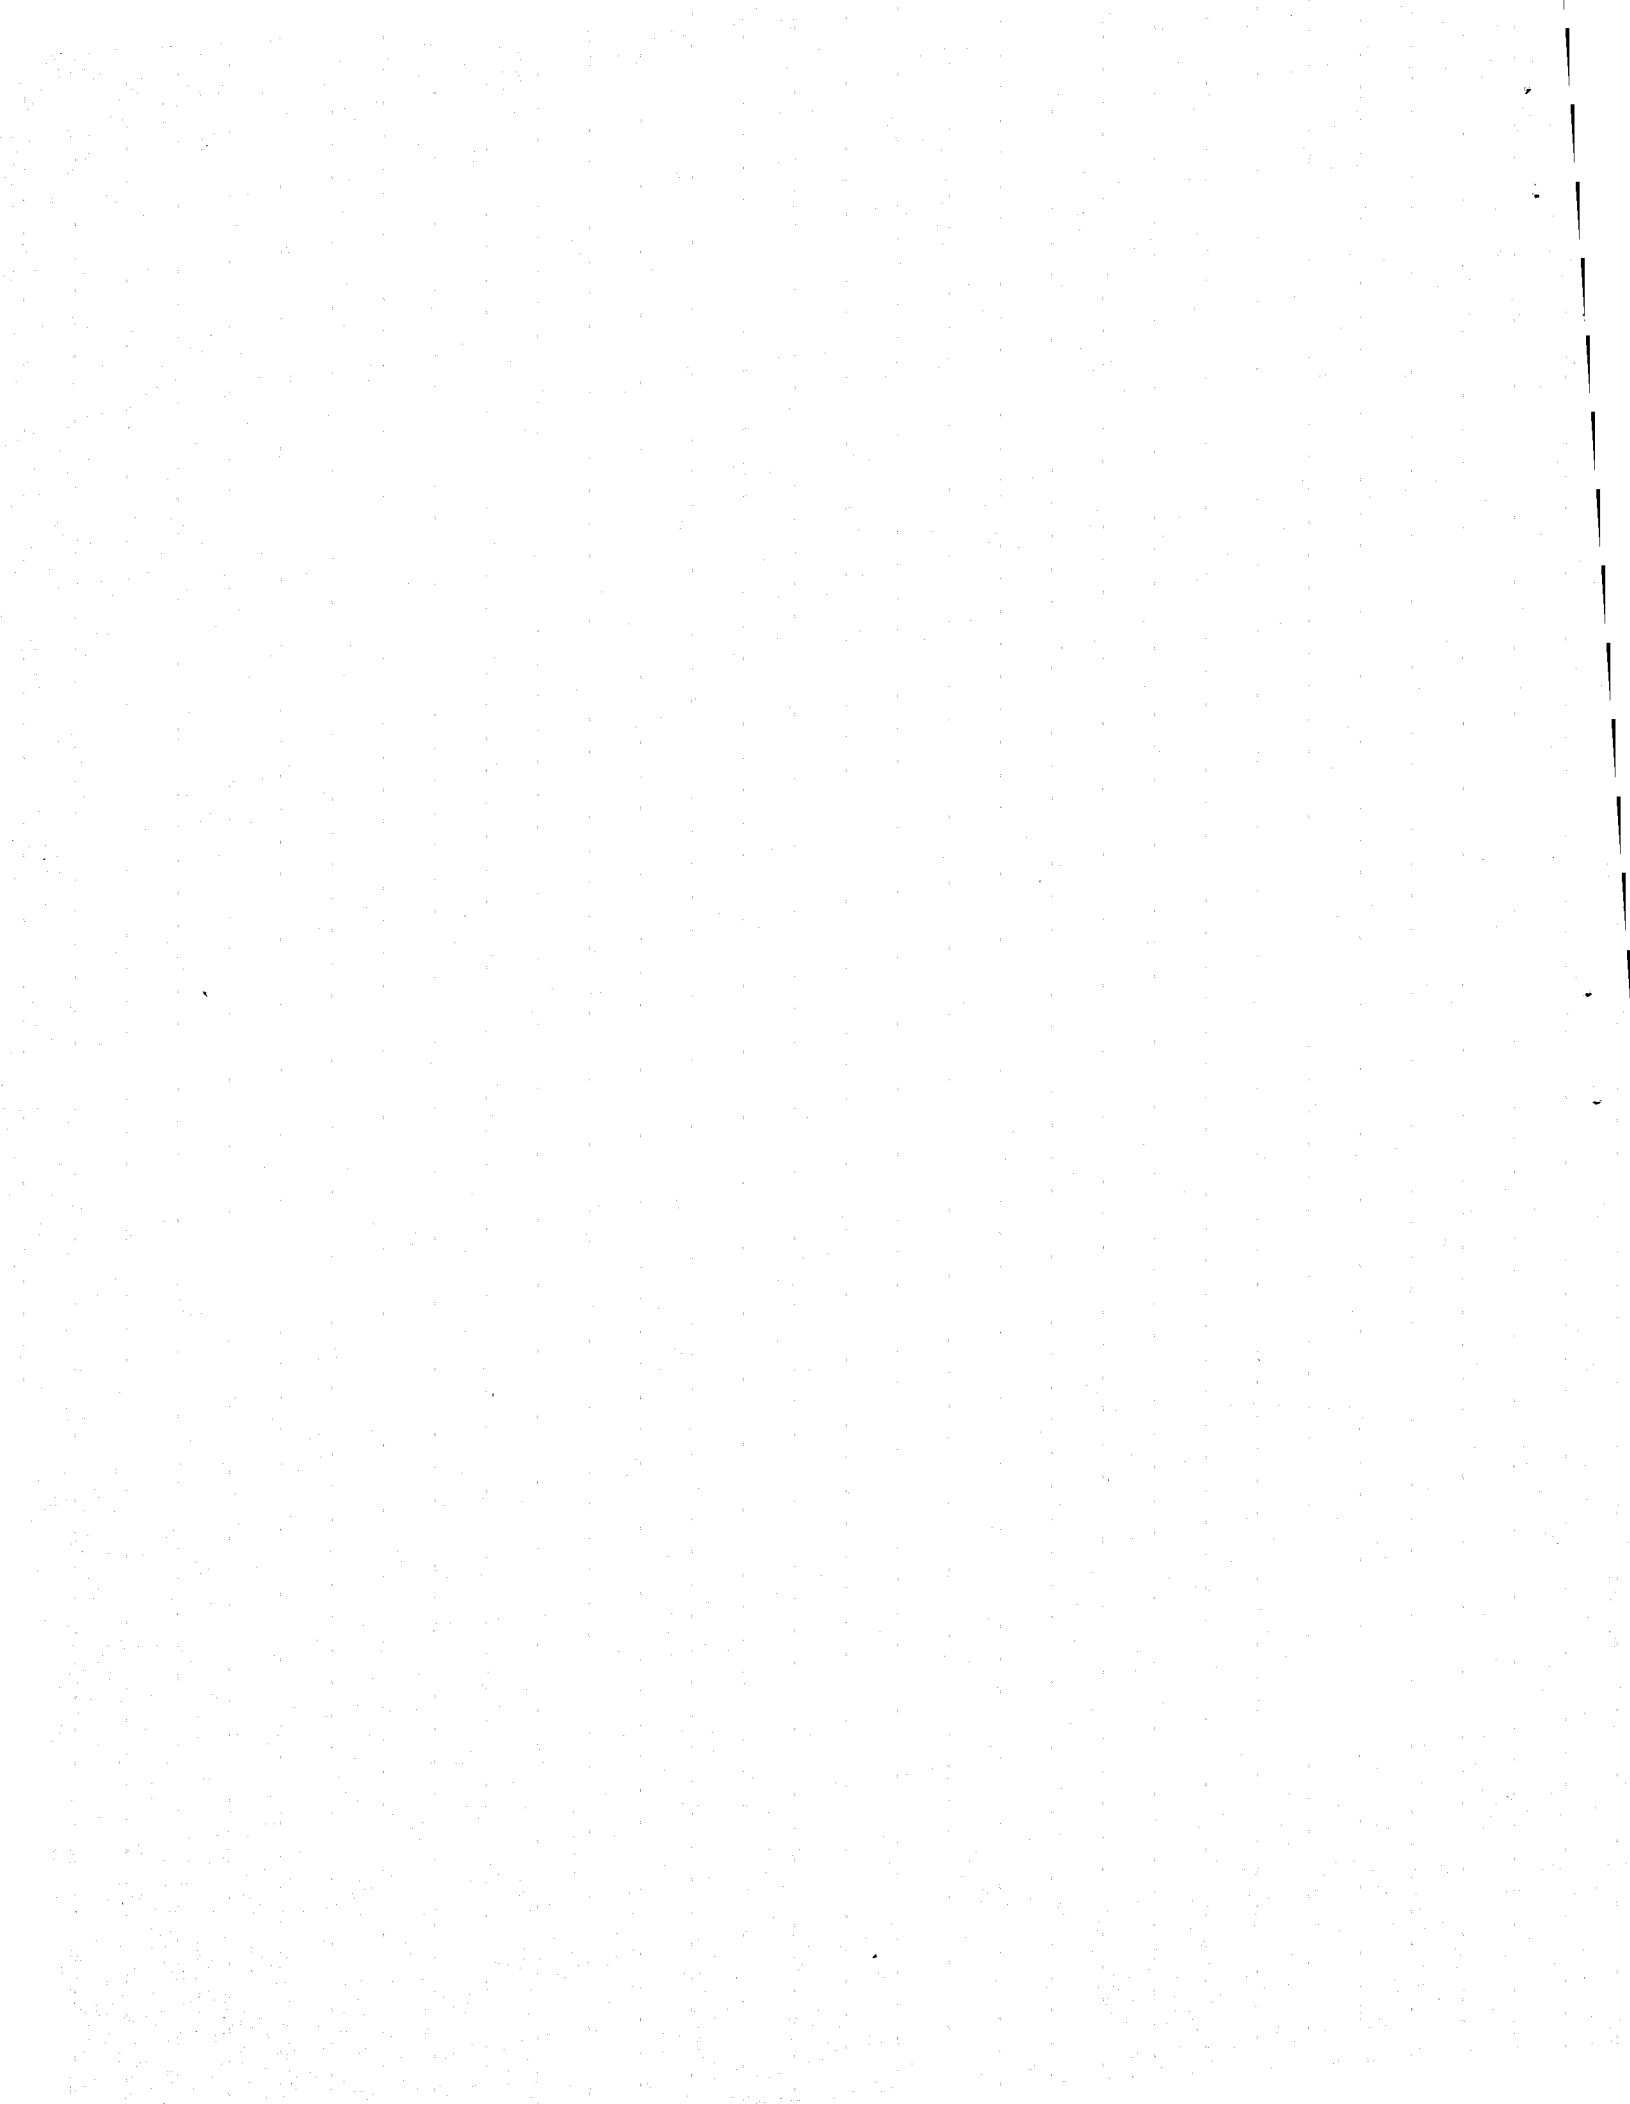

As a final word it should be noted that complete documentation of all the arrest and population data projections on the individual county level as well as complete documentation of the arrest projection model are included in the appendices. Using these appendices, the reader can draw his/her own interpretations and conclusions regarding the projections, their reliability and utility.

APPENDIX A: Detailed Arrest Projection Data for Each of the Selected Crime Types and Age Groupings by Jurisdiction

Appendix A contains a complete listing of the arrest projections by crime type and age grouping for each jurisdiction in Maryland and Baltimore City. The crime types included and for which arrests were projected are the following: Criminal Homicide, Forcible Rape, Robbery, Aggravated Assault, Burglary, Larceny, Motor Vehicle Theft, the UCR offense type entitled "All Other Offenses", Other Assaults, and Part II (less "All Other Offenses" and Other Assaults). The age groupings included and those for which arrests were projected are the following: 0-12, 13-14, 15-16, 17, 18-19, 20-24, 25-29, 30-34, 35-39, and 40+. The juvenile arrests listed by crime type were determined by summing the arrests for the 0-12, 13-14, 15-16, and 17 year old age groupings. Correspondingly, the adult arrests listed for each crime type were determined by summing the arrests for the 18-19, 20-24, 25-29, 30-34, 35-39 and 40+ age groupings.

Three tables are included for each of the jurisdictions. The first table contains the projections for 1980, 1985 and 1990 which were generated by using 1975 arrest data as the base year in the arrest projection model. Included in the second table are the arrest projections for 1980, 1985 and 1990 which were generated using 1976 arrests as the base year in the model. The third table included for each jurisdiction lists the 1980, 1985 and 1990 arrest projections by crime type and age grouping which were generated using the 1977 arrest data as the base year in the projection model. Additionally, the actual arrests by crime type and age groupings for 1975, 1976 and 1977 are included in the appropriate table. The actual arrest data listed is that from the State Police Uniform Crime Reporting Program.

## APPENDIX B: Graphical Display of Arrest Projections by County

Appendix B contains a graphical display of the arrest projections for each County in Maryland and Baltimore City. Two sets of graphs are included for each jurisdiction, one set for juvenile arrests and one set for adult arrests. Graphs for the following offense types are included in each set: Part I (less Aggravated Assault), All Assaults (Aggravated and Other), Part II (less Other Assaults and All Other Offenses), "All Other Offenses", and the Total Offenses.

Each graph contains three curves which represent the arrest projections generated by using each of the three base years of arrest and population data (i.e., 1975, 1976, and 1977 data). The graphs should provide a visual indication of any variability in arrests which occurred in the period from 1975-1977 as well as a visual indication of the estimated range of future arrests for any given year (e.g., 1980, 1985, 1990).

APPENDIX C: Estimated 1975, 1976, and 1977 Jurisdiction Population and Projected 1980, 1985 and 1990 Jurisdiction Population used in Projecting Arrests

Appendix C contains a complete listing of the estimated 1975, 1976 and 1977 jurisdiction populations and projected 1980, 1985 and 1990 jurisdiction populations by age and race. These population figures were used in the arrest projection model. The 1975, 1980, 1985 and 1990 estimated population figures listed for the 20-24, 25-29, 30-34, 35-39 and 40+ age groupings were taken directly from the May, 1977 revisions of the Maryland Projection Series on Population and Employment (1975-1990) put out by the Maryland Department of State Planning. As explained in the report narrative (Section B.III.C.), the population figures for the 0-12, 13-14, 15-16, 17 and 18-19 year age grouping as well as all of the 1976 and 1977 population figures were estimated using the Maryland Department of State Planning data as well as 1970 Census data.

APPENDIX D: Projected Changes in Jurisdiction Population - Comparison of  
1975 Population with 1980, 1985 and 1990 Population's Respectively

Appendix D contains a comparative listing of the 1975 population by age and race with the 1980, 1985 and 1990 population's by age and race for each county in the State and Baltimore City. The age groupings used are 0-14, 15-19, 20-24, 25-29, 30-34, 35-39 and 40+; the racial groupings are white and non-white. Included is the estimated percent increase or decrease in population between 1975 and 1980, 1975 and 1985, and between 1975 and 1990 for each of the age and racial groupings.

The data shown in these tables was obtained from the May, 1977 revisions of the Maryland Projection Series on Population and Employment (1975-1990) disseminated by the Maryland Department of State Planning.

## APPENDIX E: Listing of Computer Program Used to Generate Arrest Projections

Appendix E contains a flow chart description of the computerized arrest projection model as well as a listing of the corresponding Fortran computer program used to develop the arrest projections. The line numbers listed beside the boxes (or circles) in the flow chart refer to the line numbers of the corresponding instructions in the Fortran program listing. For example, the instructions to calculate the arrest rates by age and race are listed in lines 118-124 of the computer program. A verbal explanation of the arrest projection model is included in Section B.I. of this report.
