X Criminal Victimization Survey in

X Compton, California

1973/74.

PREFACE

This report is based on the findings of a victimization survey taken in Compton, Calif. or, as part of a statistical program known as the National Crime Survey. The program assesses the extent and character of criminal victimization through a representative probability sampling of households and commercial establishments. It has had two main elements--a continuous national survey and surveys in selected cities. The surveys are designed and conducted for the Law Enforcement Assistance Administration by the U.S. Bureau of the Census.

The survey conducted in Compton gaged the extent to which residents age 12 and over, households, and places of business were victimized by selected crimes, whether completed or attempted, that are of major concern to the general public. For the personal sector, the crimes are rape, robbery, assault, and personal larceny; for the household sector, burglary, household larceny, and motor vehicle theft; and for the commercial sector, burglary and robbery. The surveys enable examination of the characteristics of victims and the circumstances of each recorded incident (or victimization), exploring, as appropriate, such subjects as the number and relationship of victims and offenders, time and place of occurrence, injury or economic loss sustained, whether a weapon was used, victim self-protection measures, whether the police were notified, and if not, reasons advanced for not notifying them. The survey in Compton was intended to provide a baseline measure of common crime prior to the implementation of new criminal justice programs in that city.

It was carried out during the last quarter of 1974 and covered criminal acts that took place during the 12-month period prior to the month of the interview, a time frame roughly comparable with the last quarter of 1973 through the third quarter of 1974. Information was obtained through interviews in approximately 6,300 households (encompassing some 15,800 residents age 12 and over) and in all of the city's commercial establishments (about 1,700). Respondents furnished detailed personal and household data (or information about commercial establishments) in addition to information on each criminal act incurred.

With respect to crimes against persons, information recorded by the National Crime Survey program is based on either incidents or victimizations. An incident is a specific criminal act involving one or more victims and one or more offenders. A victimization is a specific criminal act as it affects a single victim. Thus, the number of victimizations usually is greater than the number of incidents, because more than one victim may be involved in any given incident. For crimes against households and commercial establishments, "incident" and "victimization" are synonymous, each criminal act against a household or business being assumed to involve a single victim--the affected household or establishment.

Analysis in this report focuses on selected criminal victimizations experienced by residents, households, and businesses of Compton. All data presented for the personal and household sectors are estimates and are subject to error arising from the fact that the information was derived from a survey rather than a complete census and that the sample used was only one of a large number that could have been selected. In a carefully designed survey, however, the variation in the final estimates that arises from sampling error can be determined rather precisely. For the commercial sector, the data are based on a complete census of all Compton businesses and therefore are not subject to sampling error.

The survey data tables in this report (Appendix II) display all statistics on which the analysis was based. Estimates based on about 10 or fewer sample cases were considered statistically unreliable and have been replaced in the data tables with the symbol (z).

Attempts to compare information in this report with data collected from the Compton police are inappropriate because of substantial differences in coverage between the survey and police statistics. A major difference arises from the fact that police statistics on the incidence of crime are derived principally from citizen reports to the police, whereas the survey data also include crimes not reported to the police.

Survey data reflect only those crimes experienced by residents and commercial establishments of Compton, even though some of these acts took place outside the city, and they exclude criminal acts committed within the city against nonresidents. On the other hand, police statistics include all crimes that occur within the city limits regardless of the victim's place of residence, and they exclude crimes experienced by city residents in other localities.

Personal crimes covered in the survey related only to persons age 12 and over, whereas police statistics count crimes against persons of any age. Furthermore, the survey does not measure some offenses, e.g., homicide, kidnaping, white-collar crimes, and commercial larceny (shoplifting and employee theft), that are included in police statistics, and the counting and classifying rules for survey and police statistics are not usually fully compatible.

Unlike the crime rates developed from police statistics, the personal victimization rates cited in this report are based on victimizations rather than on incidents and are calculated on the basis of the resident population age 12 and over rather than on the total population. Victimization rates for crimes against households and commercial establishments are based, respectively, on the number of households and businesses, whereas rates derived from police statistics for these crimes generally are based on the total population.

TABLES

1. Personal, household, and commercial crimes: Number and percent distribution of victimizations, by sector and type of crime 101
2. Personal, household, and commercial crimes: Victimization rates, by sector and type of crime 102
3. Personal crimes: Victimization rates for persons age 12 and over, by type of crime and sex of victims 103
4. Personal crimes: Victimization rates for persons age 12 and over, by type of crime and age of victims 104
5. Personal crimes: Victimization rates for persons age 12 and over, by sex and age of victims and type of crime 105
6. Personal crimes: Victimization rates for persons age 12 and over, by type of crime and race of victim 106
7. Personal crimes: Victimization rates for persons age 12 and over, by type of crime and sex and race of victims 107
8. Personal crimes: Victimization rates for persons age 12 and over, by race and age of victims and type of crime 108
9. Personal crimes: Victimization rates for persons age 12 and over, by race, sex, and age of victims and type of crime 109

10.	Personal crimes: Victimization rates for persons age 12 and over, by type of crime and marital status of victims	110
11.	Personal crimes: Victimization rates for persons age 12 and over, by sex and marital status of victims and type of crime	111
12.	Personal crimes: Victimization rates for persons age 12 and over, by type of crime and annual family income of victims	112
13.	Personal crimes: Victimization rates for persons age 12 and over, by race and annual family income of victims and type of crime	113
14.	Household crimes: Victimization rates, by type of crime and race of head of household	114
15.	Motor vehicle theft: Victimization rates on the basis of thefts per 1,000 households and of thefts per 1,000 vehicles owned, by selected household characteristics .	115
16.	Household crimes: Victimization rates, by type of crime and age of head of household	116
17.	Household crimes: Victimization rates, by type of crime and annual family income	117
18.	Household burglary: Victimization rates, by race of head of household, annual family income, and type of burglary	118
19.	Household larceny: Victimization rates, by race of head of household, annual family income, and type of larceny	119

20.	Motor vehicle theft: Victimization rates, by race of head of household, annual family income, and type of theft	120
21.	Household crimes: Victimization rates, by type of crime and number of persons in household	121
22.	Household crimes: Victimization rates, by type of crime, form of tenure, and race of head of household	122
23.	Household crimes: Victimization rates, by type and number of units in structure occupied by household	123
24.	Commercial crimes: Victimization rates, by characteristics of victimized establishments and type of crime	124
25.	Personal crimes of violence: Number of victimizations and victimization rates for persons age 12 and over, by type of crime and victim-offender relationships	125
26.	Personal crimes of violence: Percent of victimizations involving strangers, by sex and age of victims and type of crime	126
27.	Personal crimes of violence: Percent of victimizations involving strangers, by sex and race of victims and type of crime	127
28.	Personal crimes of violence: Percent of victimizations involving strangers, by sex and marital status of victims and type of crime	128

29. Personal crimes of violence: Percent of victimizations involving strangers, by race and family income of victims and type of crime 129
30. Personal crimes of violence: Percent distribution of single - offender victimizations, by type of crime and perceived age of offender 130
31. Personal crimes of violence: Percent distribution of single - offender victimizations, by type of crime and perceived race of offender 131
32. Personal crimes of violence: Percent distribution of single - offender victimizations, by type of crime, age of victims, and perceived age of offender..... 132
33. Personal crimes of violence: Percent distribution of single - offender victimizations, by type of crime, race of victims, and perceived race of offender 133
34. Personal crimes of violence: Percent distribution of multiple - offender victimizations, by type of crime and perceived age of offenders 134
35. Personal crimes of violence: Percent distribution of multiple - offender victimizations, by type of crime and perceived race of offenders 135
36. Personal crimes of violence: Percent distribution of multiple - offender victimizations, by type of crime, age of victims, and perceived age of offenders 136

37. Personal crimes of violence: Percent distribution of multiple = offender victimizations, by type of crime, race of victim , and perceived race of offenders 137
38. Personal crimes: Number of incidents and victimizations and ratio of incidents to victimizations, by type of crime' 138
39. Personal crimes of violence: Percent distribution of incidents, by victim = offender relationships, type of crime, and number of victims 139
40. Personal crimes of violence: Percent distribution of incidents, by type of crime and victim = offender relationships 140
41. Personal, household, and commercial crimes: Percent distribution of incidents, by type of crime and time of occurrence 141
42. Personal robbery and assault by armed or unarmed offenders: Percent distribution of incidents, by type of crime and offender and time of occurrence 142
43. Personal crimes of violence: Percent distribution of incidents, by victim = offenders relationship, type of crime, and time of occurrence 143
44. Selected personal and household crimes: Percent distribution of incidents, by type of crime and place of occurrence 144

45. Personal robbery and assault by armed or unarmed offenders: Percent distribution of incidents, by type of crime and offender and place of occurrence 145
46. Personal crimes of violence: Percent distribution of incidents, by victim = offender relationships, type of crime, and place of occurrence 146
47. Larcenies not involving victim = offender contact: Percent distribution of incidents, by type of crime and place of occurrence 147
48. Larcenies not involving victim = offender contact: Percent distribution of incidents, by type of crime, place of occurrence, and value of theft loss 148
49. Personal crimes of violence: Percent distribution of incidents, by victim = offender relationships, type of crime, and number of offenders 149
50. Personal crimes of violence: Percent of incidents in which offenders used weapons, by type of crime and victim = offender relationship 150
51. Personal crimes of violence: Percent distribution of types of weapons used in incidents by armed offenders, by victim = offender relationships, type of crime, and type of weapon 151
52. Commercial robbery: Percent of incidents in which offenders used weapons, by type of crime and type of weapon 152

53. Personal crimes of violence: Percent of victimizations in which victims sustained physical injury, by selected characteristics of victims and type of crime..... 153
54. Personal crimes of violence: Percent of victimizations in which victim incurred medical expenses, by selected characteristics of victims and type of crime 154
55. Personal crimes of violence: Percent distribution of victimizations in which victims incurred medical expenses, by selected characteristics of victims, type of crime and amount of expenses 155
56. Personal crimes of violence: Percent of victimizations in which injured victims had health insurance coverage or were eligible for public medical services, by selected characteristics of victims 156
57. Personal crimes of violence: Percent of victimizations in which victims received hospital care, by selected characteristics of victims and type of crime 157
58. Personal crimes of violence: Percent distribution of victimizations in which victims received hospital care, by selected characteristics of victims, type of crime, and type of hospital care 158
59. Personal, household, and commercial crimes: Percent of victimizations resulting in economic loss, by type of crime and type of loss 159

60.	Personal crimes of violence: Percent of victimizations resulting in economic loss, by type of crime, type of loss, and victim = offender relationships	160
61.	Personal and household crimes: Percent distribution of victimizations resulting in economic loss, by race of victims, type of crime, and value of loss	161
62.	Selected personal crimes: Percent distribution of victimizations resulting in theft loss, by race of victims, type of crime, and value of loss	163
63.	Personal and household crimes: Percent distribution of victimizations resulting in theft loss, by race of victims, type of crime, and proportion of loss recovered	164
64.	Personal and household crimes: Percent distribution of victimization in which theft losses were recovered, by type of crime and method of recovery of loss	165
65.	Household crimes: Percent distribution of victimizations resulting in theft loss, by value of loss and type of crime	166
66.	Commercial crimes: Percent of victimizations resulting in economic loss, by kind of establishment, type of crime, and type of loss	167
67.	Commercial burglary: Percent distribution of victimization resulting in economic loss, by kind of establishment and value of loss	168

68.	Commercial robbery: Percent distribution of victimizations resulting in theft loss, by kind of establishment and value of loss	169
69.	Commercial crimes: Percent distribution of victimizations resulting in theft loss, by proportion of loss recovered and type of crime	170
70.	Personal, household, and commercial crimes: Percent of victimizations resulting in loss of time from work, by type of crime	171
71.	Personal and household crimes: Percent of victimizations resulting in loss of time from work, by type of crime and race of victim	172
72.	Personal crimes of violence: Percent of victimizations resulting in loss of time from work, by type of crime and victim = offender relationship	173
73.	Personal and household crimes: Percent distribution of victimizations resulting in loss of time from work, by type of crime and number of days lost	174
74.	Personal crimes of violence: Percent distribution of victimizations resulting in loss of time from work, by number of days lost and victim = offender relationship.....	175
75.	Personal and household crimes: Percent distribution of victimizations resulting in loss of time from work, by race of victims, type of crime, and number of days lost	176

76. Commercial crimes: Percent distribution of victimizations, by type of crime and number of days lost from work 177
77. Personal, household, and commercial crimes: Percent of victimizations reported to the police, by type of crime 178
78. Personal crimes: Percent of victimizations reported to the police, by type of crime, victim = offender relationship, and sex of victims 179
79. Personal crimes: Percent of victimizations reported to the police, by type of crime and age of victims 180
80. Personal crimes: Percent of victimizations reported to the police, by type of crime, victim = offender relationship, and race of victims 181
81. Household crimes: Percent of victimizations reported to the police, by type of crime, race of head of household, and form of tenure 182
82. Household crimes: Percent of victimizations reported to the police, by type of crime and annual family income 183
83. Personal and household crimes: Percent distribution of reasons for not reporting victimizations to the police, by type of crime 184
84. Personal crimes of violence: Percent distribution of reasons for not reporting victimizations to the police, by victim = offender relationship and type of crime 185

85.	Household crimes: Percent distribution of reasons for not reporting victimizations to the police, by race of head of household and type of crime.....	186
86.	Household crimes: Percent distribution of reasons for not reporting victimizations to the police, by annual family income	187
87.	Household crimes: Percent distribution of selected reasons for not reporting victimizations to the police, by race of head of household and annual family income	188
88.	Household crimes: Percent distribution of reasons for not reporting victimizations to the police, by type of crime and value of theft loss.....	189

HIGHLIGHTS
SELECTED FINDINGS FROM THE HOUSEHOLD SURVEY

General Findings.

Personal victimizations of persons age 12 and over were about equally divided between crimes of violence (assault, robbery, and rape) and crimes of theft (personal larceny without contact, purse snatching, and pocket-picking).

Household victimizations most often involved burglary (57%). Slightly less than one-third (30%) involved household larceny and the remaining 12% involved attempted or completed automobile theft.

Victimization Rates for Personal Crimes of Violence By:

- Sex: Victimization rates were almost twice as high for males (104) as for females (58).
- Marital Status: Victimization rates were highest for never married males (166) and lowest for married females (35).
- Age: The highest rates occurred among people under age 20 (121, 141) and the lowest rates among people over age 35 (43, 41, 46).
- Race: There was some evidence that rates were higher for persons belonging to racial groups other than black or white.
- Income: The highest rates occurred among families with annual incomes of less than \$3000 (121).

Victimization Rates for Personal Crimes of Theft By:

- Sex: Victimization rates were somewhat higher for males (89) than females (72).
- Marital Status: For both men and women, victimization rates were highest among divorced/separated persons and lowest for widowed persons.
- Age: The highest rates occurred among persons between ages 20-34 (107, 99) and the lowest rate among persons over age 65 (30).
- Race: Victimization rates were higher for blacks and "others" than for whites.
- Income: Families with annual incomes over \$25,000 had the highest victimization rate (130)..

Crime Characteristics

Time of Occurrence

The majority of ALL personal crimes (56%), as well as of personal crimes of violence (57%), occurred in the daytime.

Approximately twice as many motor vehicle thefts occurred at night as during the day.

Place of Occurrence

The majority (61%) of personal crimes of violence occurred on the street or in other outdoor areas.

Half of personal larcenies involving contact (purse snatching and pocket picking) occurred on the street or outdoor area and about one-third happened inside non-residential buildings.

About 6 out of every 10 motor vehicle thefts occurred when the car was parked on the street or outdoor area; 3.5 out of every 10 took place while parked at the victim's home.

Use of Weapons

Weapons of some type were used in about half of all personal crimes of violence.

Of the personal crimes of violence in which weapons were used, firearms were present in one-half of the incidents, and knives and "other" weapons in almost one-quarter each.

Physical Injury to Victims of Personal Crimes of Violence

Physical injury occurred to victims of personal robbery and assault in about 25% of all victimizations.

Victims incurred some medical expenses in 11% of victimizations.

Victims received some hospital care in 11% of victimizations.

Economic Losses

Economic losses occurred in about two-thirds of personal crimes.

Ninety-three percent of household crimes resulted in economic loss.

Recovery of Losses

For personal crimes none of the loss was recovered in 87% of victimizations.

For household crimes none of the loss was recovered in 79% of victimizations.

Time Lost From Work

Loss of time from work resulted in 7% of all personal and 11% of all household crimes.

Offender Characteristics in Personal Crimes of Violence

Approximately half of all personal crimes of violence involved more than one offender.

Robbery was more likely than either assault or rape to have involved more than one offender.

Crimes of violence between people who knew each other were more likely than those between strangers to have involved only one offender.

About half of the offenders were perceived by their victims to have been under 21 years of age.

Victim-Offender Relationship in Personal Crimes of Violence

The offender was a stranger to the victim in three-fourths of victimizations involving personal crimes of violence.

Robbery was the most likely and assault the least likely to have involved strangers, with rape mid-way between the other two categories -- but the majority of victimizations for each of these crimes still involved strangers.

Reporting of Crimes to the Police

Thirty-six percent of personal crimes were reported to police.

Crimes of violence (46%) were more likely to have been reported than crimes of theft (26%).

Household crimes were more likely to have been reported than personal crimes.

The most common reasons given for not reporting a crime to police were the feeling that nothing could be done about the crime or that the crime was not important enough to report.

SELECTED FINDINGS FROM THE COMMERCIAL CENSUS

General Findings.

Commercial data are based upon a complete census of businesses in Compton.

Eighty percent of measured commercial crimes were burglaries (55% completed; 25% attempted) and twenty percent were robberies (14% completed; 6% attempted).

The victimization rate for burglary was 748 per 1000 establishments and for robbery 186 per 1000.

Of the various types of commercial establishments (retail, wholesale, service, and other) retail businesses had the highest rates for burglary (993) and robbery (313).

Time of Occurrence

Commercial burglary usually took place between 6 p.m. and 6 a.m. (83%).

Commercial robbery was more likely to occur during the daytime than at night.

Use of Weapons

Weapons of some type were used in 72% of commercial robberies. Firearms were used more often than weapons of other types.

Economic Losses

About 86% of all measured commercial crimes resulted in some form of economic loss to the business, either from theft of or damage to property or from both.

Property damage loss occurred much more often in burglaries (73%) than robberies (15%).

Theft losses occurred somewhat more frequently in robberies (69%) than burglaries (56%).

Eighty-five percent of robberies and 62% of burglaries involved losses of at least \$51.

None of the property was returned in 90% of burglaries and 87% of robberies.

Reporting of Crimes to Police

Commercial crimes, unlike personal crimes, generally were reported to police (90% of robberies and 80% of burglaries).

INTRODUCTION

Compton, California, which is adjacent to Los Angeles, is situated in the center of the general area commonly known as southern California. It is a chartered city, with a council-city manager form of government. In 1970, the city had a population of 78,611. More than 70 percent of the population at that time was black and 10 percent or more was Spanish speaking.

Compton, like most cities located within large metropolitan areas, has a mobile population. According to the 1970 census data, 60 percent of the city's residents had moved to their current residences within the previous 5 years. More than a quarter (27 percent) of the city's population had lived at their current addresses for 1 year or less. Only 9 percent of the population had had the same address for as long as 20 years. Almost half (45 percent) of the 1970 residents of Compton were born in a State other than California.

The average income in Compton in 1970 was \$9,332. Seventeen percent of all families in Compton at that time had an income lower than the poverty level as defined by the government.

Compton was chosen as a site for a victimization survey, because special programs to improve the criminal justice system were planned. The victimization survey was designed to provide a measure of both reported and unreported crime experienced by city residents and businesses before implementation of these programs.

THE SURVEY

The National Crime Survey program is designed to develop information not otherwise available on the nature of crime and its impact on society by means of victimization surveys of the general population. In each locality surveyed, samplings are made of representative households and commercial establishments to elicit information about experiences, if any, with selected crimes of violence and theft, including events that were reported to the police as well as those that were not. By focusing on the victim, the person likely to be most aware of details concerning criminal events, the surveys generate a variety of data, including information on the circumstances under which such acts occurred and on their effects on the victim, such as injury and economic loss.

As one of the most ambitious efforts yet undertaken for filling some of the gaps in crime data, victimization surveys are expected to provide criminal justice officials with new insights into crime and its victims, complementing data resources already on hand, for purposes of planning, evaluation, and analysis. The surveys subsume many of the so-called hidden crimes that, for a variety of reasons, are never brought to police attention. They also furnish a means for developing victim typologies and, for identifiable sectors of society, yield information necessary to compute the relative risk of being victimized.

Victimization surveys also can distinguish between stranger-to-stranger and domestic violence and between armed and strong-arm assaults and robberies. They can tally some of the costs of crime in terms of injury or economic loss sustained, and they can provide greater understanding as to why certain criminal acts are not reported to police authorities. Conducted periodically in the same area, victimization surveys provide the inputs necessary for developing indicators sensitive to fluctuations in the levels of crime; conducted under the same procedures in different locales, they provide a basis for comparing the crime situation between two or more cities or other geographic areas.

Victimization surveys, such as those conducted under the National Crime Survey program, are not without limitations, however. Although capable of covering those crimes that are of major interest to the general public, they cannot measure all criminal activity, as a number of crimes are not amenable to examination through the survey technique.

Surveys have proved most successful in estimating the extent of crime with specific victims, who are willing to report what they know and who understand what happened to them and how it happened. More specifically, they have been shown to be most applicable to rape, robbery, assault, burglary, and both personal and household larceny, including motor vehicle theft. Accordingly, the National Crime Survey is designed to focus on these crimes. Among other offenses, murder and kidnaping are not covered, since obtaining information from the victim is impossible in murder and unsuitable in the kidnaping of children. The so-called victimless crimes such as drunkenness, drug abuse, and prostitution are excluded, as are those crimes for which it is difficult to identify knowledgeable respondents or to locate comprehensive data records, as

in offenses against government entities. ^{1/} Examples of the latter are income tax evasion and the theft of office supplies.

Crimes of which the victim may not be aware also cannot be measured effectively by the survey technique. Buying stolen property may fall into this category, as may some instances of fraud and embezzlement. Attempted crimes of most types probably are underrecorded for this reason.

Commercial larcenies (e.g., employee theft and shoplifting) have to date not proved susceptible to measurement or study by means of the survey approach because of the limited documentation maintained by most commercial establishments on losses from these crimes.

Finally, crimes in which victim's have shown a willingness to participate in illegal activity also are excluded. Examples of the latter, which are unlikely to be reported to interviewers, include gambling, various types of swindles, con games, and blackmail.

^{1/} Government institutions and offices do not fall within the purview of the National Crime Survey. Pretests have indicated that government organization records on crime generally are inadequate for survey purposes.

The success of any victimization survey hinges on the degree of cooperation that interviewers receive from respondents. In the Compton Victimization survey, interviews were obtained in an average of 94 percent of the households occupied by persons eligible for interview. In the commercial census, the average response rate was about 97 percent of all business establishments in the city.

Data from victimization surveys are subject to response error. In an attempt to measure errors in reporting incidents and check on the consistency of item response, reinterviews were conducted in 8 percent of the originally interviewed households in Compton. Original responses were checked against those provided in the reinterview and, when necessary, the data reconciled. Significance tests were calculated on both personal and property crime incident rates generated from the original, reinterview, and reconciled data to determine if there were significant differences among them. In Compton, the reconciled rate for property crimes was significantly higher than the original rate. There were no significant differences for personal crimes.

Closely related to the problem of victim recall is the phenomenon of telescoping, that is, the tendency of some respondents to recount incidents occurring outside (usually before) the referenced time frame. This tendency can be controlled by using a bounding technique, whereby the first interview is used as a benchmark for data gathered during the second and subsequent interviews, as is employed in the National Crime Survey's nationwide sample. Because the Compton survey was not continuous, however, such a technique was not used. Thus, the data derived from this survey have not been adjusted for telescoping, nor the magnitude of telescoping determined.

While telescoping may have tended to somewhat inflate the number of criminal victimizations tallied in the survey, substantial numbers of victimizations were purposely excluded from the main tabulations of survey results; they also were excluded from consideration in computing victimization rates. These were the so-called series victimizations, groupings of three or more criminal events similar if not identical in nature and experienced by persons who were unable to identify separately the details of each act. In some cases, the victims were unable to recount accurately the total number of such acts. Had it been feasible to make a precise tally of all instances of victimizations that occurred in series, their inclusion in the processing of survey results would have caused certain alterations in the portrayal of criminal victimization. Rates of victimization, for example, would have been higher; however, because of the inability of victims to furnish details concerning their experiences, it would have been impossible to analyze the characteristics of the acts. But, while the estimated number of series victimizations was appreciable, the number of victims who actually experienced such acts was small in relation to the total number of individuals who were victimized one or more times and who had firm recollections of each event.

While it might be assumed that a victimization survey in Compton would reflect the occurrence of crime within that city, this is not precisely the case. The survey examines only those victimizations experienced by city residents age 12 and over at the time of the interviews and by businesses in the city. The data thus generated pertain solely to these residents and commercial firms, and consequently the number of incidents reported does not coincide with the actual incidence of corresponding crimes in the city. Excluded from the city survey are victimizations experienced inside the city limits by nonresidents. Thus the survey is unable to provide estimates of the volume of such crime.

Furthermore, the survey covers all of the relevant victimizations experienced by city residents anywhere in the United States. These could have taken place while victims were on business or vacation trips, or were shopping or visiting outside the city. Moreover, if victims had moved to the surveyed city during the 12 months before the interview, the victimizations may have occurred at the previous places of residence. For example, the Compton data indicate that 17 percent of incidents of personal theft and 14 percent of incidents of assaultive violence with theft occurred outside Compton.

Data emanating from the National Crime Survey program can be examined from various perspectives. They can be analyzed along conceptual lines, by subjects such as time and place of occurrence. They can be grouped into crimes against persons and crimes against property. Or they can be classified according to victim typology. Within the three basic targets, or sectors, of criminal victimization dealt with by the National Crime Survey--persons, households, and commercial establishments survey results used in the preparation of this report have been grouped by type of crime. In the following discussion, the relevant crimes for each sector are described in detail. 2/

2/ Definitions of the measured crimes do not necessarily conform to any Federal or State statutes, which vary considerably. They are, however, compatible with conventional usage and with the definitions used by the Federal Bureau of Investigation in its annual publication "Crime in the United States, Uniform Crime Reports." Succinct and precise definitions of the crimes and other terms used in National Crime Survey reports appear in the glossary at the end of this report.

CRIMES AGAINST PERSONS

Crimes against persons have been divided into two general types: crimes of violence and crimes of theft. Personal crimes of violence comprising rape, personal robbery, and assault bring the victim into direct contact with the offender. Personal crimes of theft may or may not involve contact between the victim and the offender.

Rape, one of the most serious and least common of all the crimes measured by the National Crime Survey, is carnal knowledge through the use or threat of force, excluding statutory rape (without force). Both completed and attempted acts are included, as are incidents of both homosexual and heterosexual rape.

The object of personal robbery is to relieve a person of property by force or the threat of force. The force employed may be a weapon (armed robbery) or physical power (strong-arm robbery). In either instance, the victim is made to feel that he or she is in physical danger, and physical injury can and sometimes does result. The distinction between robbery with injury and robbery without injury turns solely on whether the victim sustains any injury, no matter how minor. The distinction between a completed robbery and an attempted robbery centers on whether there is any loss of cash or property. For example, an incident might be classified as an attempted robbery simply because the victim is not carrying anything of value when held up at gunpoint. Attempted robberies, however, can be quite serious and can result in severe physical injury to the victim.

The classic image of a robbery is that of a masked offender with a gun approaching the victim on the street and saying "Put your hands up." Robbery can, of course, occur anywhere, on the street or in the home. It may be an encounter as dramatic as the one described, or it may simply involve a victim's being pinned briefly to a schoolyard fence by one classmate while another classmate makes off with the victim's lunch money.

The object of assault is to do physical harm to the victim. The conventional categories of assault are "aggravated" and "simple." An assault carried out with a weapon is considered aggravated, whether there is any injury or regardless of the degree of injury. An assault carried out without a weapon is also an aggravated assault if the attack results in serious injury. Simple assault occurs when no weapon is used and there is no injury or injury is minor. Within the general category of assault are incidents with results no more serious than a minor bruise and incidents that bring the victim near death.

Attempted assault differs from assault carried out in that in the latter the victim is physically attacked and may incur bodily injury. An attempted assault could be the result of bad aim with a gun, or it could be a nonspecific verbal threat to harm the victim. It is difficult to categorize attempted assault as either aggravated or simple because it is conjectural how much injury, if any, the victim would have sustained had the assault been carried out. In some instances, there may have been no intent to carry out the crime. Not all threats of harm are issued in earnest; a verbal threat or a menacing gesture may have been all the offender intended. The intent of the offender obviously cannot be measured in a victimization survey. In the National Crime Survey Program, attempted assault with a weapon has been classified as an aggravated assault and attempted assault without a weapon as simple assault.

Although the most fearsome form of assault is the brutal, senseless attack by an unknown assailant, it is also the most rare. Much more common is the incident in which the victim is involved in a minor scuffle or a domestic spat. There is reason to believe that incidents of assault stemming from domestic quarrels are underreported in victimization surveys because some victims do not consider such events as crimes.

Personal crimes of theft, synonymous with personal larcenies, involve the theft of cash or property by stealth. Such crimes may or may not bring the victim into direct contact with the offender. Personal larceny with contact encompasses purse snatching, attempted purse snatching, and pick ^opicking. Personal larceny without contact embraces the theft by stealth of numerous kinds of items, which need not be strictly personal in nature. It is distinguished from household larceny solely by place of occurrence: Household larceny transpires only in the home or its immediate environs; personal larceny can take place at any other location.

Examples of personal larceny without contact include the theft of a briefcase or umbrella from a restaurant, a portable radio from a beach, clothing from an automobile parked in a shopping center, a bicycle from a schoolground, and food from a shopping cart in front of a supermarket. Lack of force is a major identifying element in personal larceny. For example, should a woman resist a purse-snatching attempt and the offender then use force, the crime would escalate to robbery.

CRIMES AGAINST HOUSEHOLDS

The three measured crimes against households-- burglary, household larceny, and motor vehicle theft-- are crimes that do not involve personal confrontation. Were such confrontations involved, the crime would be transformed from a household crime to a personal crime, and the victim would no longer be the household itself but rather the member of the household involved in the confrontation. For example, if members of the household surprised a burglar in their home and then were threatened or harmed by the intruder, the act would be classified as assault. If the intruder were to demand or take cash and/or property from the household members, the event would be classified as robbery.

The most serious of the crimes against households is burglary. Burglary is the illegal or attempted entry of a structure. While the assumption is that the purpose of the entry was to commit a crime, usually theft, no additional crime need take place for a burglary to occur. The entry may be by force (such as picking a lock, breaking a window, or slashing a screen) or it may be through an unlocked door or an open window. As long as the person entering has no legal right to be present in the structure, a burglary has occurred. Furthermore, the structure need not be the house itself for a household burglary to take place. Illegal entry of a garage, shed, or any other structure on the premises also constitutes a household burglary. In fact, burglary does not necessarily have to occur on the premises. If the breaking and entering occurs in a hotel or vacation residence, it would still be classified as a household burglary for the household whose member or members are involved.

As mentioned earlier, household larceny occurs when cash or property is removed from the home or its immediate vicinity by stealth. For a household larceny to occur within the home itself, the thief must be someone with a right to be there, such as a maid, a delivery person, or a guest. If the person has no right to be there, the crime is a burglary. Household larceny may consist of the theft, for example, of jewelry, clothes, lawn furniture, garden hoses, or silverware.

The theft or unauthorized use of motor vehicles, commonly regarded as specialized forms of household larceny, are treated separately in the National Crime Survey Program. Completed as well as attempted acts involving automobiles, trucks, motorcycles, and other vehicles legally entitled to use public streets are included.

CRIMES AGAINST COMMERCIAL ESTABLISHMENTS

Although commercial crimes, as the term is used in this report, consist primarily of victimizations of business establishments, they also include a relatively small number of offenses committed against certain other organizations, described in the introduction to Appendix III.

Only two types of commercial crimes are measured by the National Crime Survey program: robbery and burglary. These crimes are comparable to robbery of persons and burglary of households except that they are carried out against places of business rather than individuals or households. Unlike household burglary, however, commercial burglary can take place only on the premises of business firms. In a robbery of a commercial establishment, as in a personal robbery, there must be personal confrontation and the threat or use of force. Commercial robberies usually occur on the premises of places of business but can happen away from the premises, such as during the holdup of sales or delivery personnel away from the establishment.

GENERAL FINDINGS

As determined by the National Crime Survey Program, there were about 18,000 victimizations stemming from selected crimes of violence and common theft, including attempts, reported by residents of Compton, Calif., as having occurred between October 1973 and September 1974. About 7,500 of these victimizations were against persons age 12 and over, about 9,300 were directed toward households, and about 1,200 affected business establishments and other organizations. 3/

3/ Although commercial crimes, as the term is used in this report, consist primarily of victimizations of business establishments, they also include a relatively small number of offenses committed against certain other organizations, such as those engaged in religious, political, or cultural activities.

Of the crimes against persons age 12 and over, victimizations were about equally divided between those involving crimes of violence and those involving crimes of theft. Almost all of the personal crimes of violence involved robbery or assault and almost all of the personal crimes of theft involved personal larceny without contact. Rape and personal larceny with contact together accounted for only about 5 percent of victimizations within the personal sector.

About 57 percent of victimizations against households involved burglary, about 30 percent involved household larceny, and about 12 percent were motor vehicle thefts.

About 80 percent of victimizations against business establishments and other organizations, involved burglary and the other 20 percent involved robbery.

In order to assess the impact of these criminal acts upon society and the business community, rates of victimization have been calculated for each crime. Victimization rates are measures of occurrence; they are derived by dividing the number of victimizations associated with a specific crime or grouping of crimes by the number of persons or units (whether households or businesses) in the particular group under consideration. For crimes against persons, the rates are based on the total number of individuals age 12 and over or on whatever portion of this population is being examined. Since crimes against households are regarded as being directed against the household as a unit rather than against individual members in calculating a rate, the denominator of the fraction is the number of households in question. Similarly, the rates for the crimes against commercial establishments are related to the number of businesses being studied.

As indicated previously, a victimization is a specific criminal act as it affects a single victim. In crimes against persons, more than one victimization can occur at the same time, as in the simultaneous robbery of two or more individuals. Also, one person may be victimized several times during the course of the reporting period. Some individuals no doubt are more vulnerable to victimization than others, whether because of lifestyle, occupation, place of residence, carelessness, or circumstances beyond personal control. Victimitizations of households and businesses, unlike those of persons, cannot involve more than one victim during any given criminal act, but there can be repeated victimizations at varying time intervals. As expressed by victimization rates, therefore, the risk of having become a victim was not equal.

The use of victimization rate data makes it possible to convert levels of victimization into more meaningful form. For example, although commercial burglaries account for only 5 percent of all crimes and household burglaries account for about 30 percent, the risk of victimization from burglary was about 2-1/2 times as great for commercial establishments as for private households. And the risk of victimization from a robbery was about six times as great for a commercial establishment as for an individual.

Victimization rates for personal, household and commercial sectors, by relative risk of victimization for various crimes.

<u>Type of crime</u>	<u>Rate per thousand</u>
Commercial burglary	748
Household burglary	293
Commercial robbery	186
Household larceny	156
Personal larceny without contact	74
Motor vehicle theft	61
Personal assault	45
Personal robbery	31
Personal larceny with contact	6
Rape	2

In the various categories of personal crimes, the risk of victimization generally was lower for the more serious crimes. For example, personal larceny involving contact posed much less risk (6) than did personal larceny without contact (74). Likewise, the risk of robbery involving injury was less (9) than robbery without injury (22). An exception to this trend occurred with assault, in which the rate for the more serious crime of aggravated assault was higher (26) than for simple assault (19). In the categories of simple and aggravated assault, however, the rates for the more serious crime of assault with injury were lower (4, 7) than for the less serious crime of attempted assault (15, 19).

In crimes against households, the trend was reversed, with victimization rates for the more serious offenses generally being higher than for the less serious ones. For example, the victimization rate for burglary with forcible entry (the most serious form of burglary) was much higher (174) than that for either of the less serious forms: unlawful entry without force (57) or attempted forcible entry (62). For motor vehicle theft the victimization rate was higher for completed thefts (45) than for attempted thefts (16). In the category of household larceny, the rate was lower for the costlier offenses--those involving thefts valued at \$50 or more (65)--than it was for thefts of less than \$50 (74). However, the rates for these two categories of completed larcenies were much higher than for the least serious form of the crime, attempted household larceny (12).

In commercial crimes victimization rates were much higher for completed burglaries and robberies than for attempted crimes of these types.

DETAILED FINDINGS--CRIMES AGAINST PERSONS AND HOUSEHOLDS

VICTIM CHARACTERISTICS

CRIMES AGAINST PERSONS

In order to indicate the extent to which different sectors of Compton were affected by crime, the general rates of victimization discussed in the previous section were recalculated on the basis of personal characteristics: sex, age, race, marital status, and annual family income. Family income reflects the monetary income from all sources received by the head of the household and all of his or her relatives living in the same household unit; it excludes the income of household members unrelated to the head of household.

Sex

For personal crimes of violence, the victimization rate for males (104) was almost twice as high as that for females (58). For personal crimes of theft, the rate for males (89) also was higher than that for females (72), but the difference between rates for the sexes was not as great as for violent crimes.

Marital Status and Sex

Among males, the victimization rate for personal crimes of violence was more than twice as high for those never married (166) as for those in any of the other categories--married (56), widowed (59), or divorced/separated (72). The victimization rates for personal crimes of violence were higher for divorced/separated (85), never married (78), and widowed females (53) than for married females (35).

The victimization rates for crimes of theft were highest for divorced/separated persons and lowest for widowed persons of both sexes.

Interpretations of data about victimization rates according to marital status must consider that there is an interaction between marital status and age, with never-married persons likely to be very young and widowed persons likely to fall into older age categories.

Age

For personal crimes of violence, there was a relationship between age and risk of victimization, with the highest victimization rates occurring in the two youngest age categories, covering persons under age 20 (121, 141).

The rate for violent crimes began to decline among persons age 20-24 (95) and declined further for those age 25-34 (68). The lowest victimization rates were found in the three older age categories, covering persons age 35 and over (43, 41, 46). The lower risk of victimization from violent crime among the older age categories may result from differences in lifestyle between younger and older people.

For crimes of theft, the highest rates of victimization occurred for persons age 20-24 (107) and 25-34 (99). The lowest rate was for persons over age 65 (30).

Race

For personal crimes of violence, there was some evidence that the victimization rate was higher for persons categorized as belonging to the "other" racial group 4/ (106) than it was for blacks (79) or whites (74).

Victimization rates for personal crimes of theft were higher for blacks (85) and "others"(83) than for whites (56).

Income

The highest rates of victimization for personal crimes of violence occurred among members of families with incomes of less than \$3,000 per year (121). The victimization rates for those in families in each income category above \$3,000 were one-half to one-third lower.

For personal crimes of theft, members of families with the highest incomes (more than \$25,000) were the most likely to be victimized. The rate among these upper income persons (130) was at least 1-1/2 times higher than that for members of families in lower income categories.

4/ The "other" category includes American Indians, Eskimos, and Orientals.

CRIMES AGAINST HOUSEHOLDS

The age and race considered in crimes against households are the personal characteristics of those who headed the households at the time of the survey. The number of persons in the household refers to all members of the household, regardless of age or relationship to the head of household. Annual family income includes all income from the head of household and from his or her relatives living in the same household unit.

Race

Victimization rates for burglary and household larceny were higher for households headed by persons classified as belonging to the "other" racial group and for black households than they were for white households. Calculated on the basis of 1,000 vehicles owned, motor vehicle theft rates were about the same for black households (46) and white households(41).

Age

Victimization rates for burglary and household larceny were highest among households headed by persons in the middle range of the age spectrum (20-49 years). The lowest rates of burglary victimization occurred among households headed by persons at either end of the age spectrum-the youngest (age 12-19) and the oldest (65 and over). The victimization rate for household larceny was lowest for persons 65 and over; the rate was one-half or less that of persons in other age categories.

Based on 1,000 vehicles owned, the motor vehicle theft rate was highest among households headed by persons age 20-34 and declined for household heads in age groups over 35, with the lowest rate occurring among household heads 65 and over.

Form of Tenure

Burglary and household larceny victimization rates were higher for households in which the home was owned or being bought than they were for households in which the home was being rented.

Family Income

In general, the risk of victimization from burglary or larceny was greatest for families in the higher income categories, although there was not always a direct relationship between income and victimization risk. Burglary victimization rates were higher in the three upper income brackets, covering incomes of \$10,000 and more, than they were for the categories of income of less than \$10,000. Household larceny victimization rates were highest among families with incomes of \$25,000 and more and with incomes between \$10,000 and \$14,999. They were lowest among families with incomes in the two categories of less than \$7,500.

Rates for motor vehicle theft computed on the basis of rate per 1,000 households tended to rise as income increased.

CRIME CHARACTERISTICS

This section of the report details certain characteristics of the crimes measured by the National Crime Survey in Compton. For crimes against persons in which contact occurred between victim and offender, some of the topics are based on incident data and others on victimization data. This difference in treatment stems from the fact that incident data permit study of certain circumstances surrounding the occurrence of criminal acts, whereas victimization data enable a more accurate assessment of the consequences of such acts for victims. Thus, the analysis of four subjects--time of occurrence, place of occurrence, number of offenders, and use of weapons--is based on incidents. The victimization is the basic unit of measure for the three remaining topics: victim injury, economic loss, and time lost from work.

Another difference in the analytical treatment of data stems from the relevance of given characteristics to various types of crime. For example, characteristics such as time and place of occurrence are pertinent to each of the survey-measured crimes. Other characteristics, including use of weapons and injury to victims, are applicable only to crimes that bring victim and offender into contact and are accompanied by the use or threat of force.

As indicated previously, victimizations ordinarily outnumber incidents because more than one individual may have been victimized during any given incident of a personal crime involving victim-offender contact. Overall, the survey enumerated about 3,120 incidents of crimes of violence against persons age 12 and over, compared to 3,743 personal victimizations. Ninety percent of these incidents involved only one victim. Of the 10 percent of incidents in which more than one person was victimized, 6 percent involved two victims, 2 percent involved three victims, and 2 percent four or more victims.

TIME OF OCCURRENCE

Information on the time of day when criminal incidents occur can be helpful to law enforcement officials concerned with patterns of criminal behavior, as well as to citizens wishing to lower their risk of being victimized. For each of the crimes measured by the National Crime Survey program in Compton, data on when incidents occurred were obtained for three broad time intervals: the daytime hours (6 a.m. to 6 p.m.), the first half of nighttime (6 p.m. to midnight), and the second half of nighttime (midnight to 6 a.m.).

It is common for people to feel relatively more secure during the daylight hours than at night. But in Compton the majority of all personal crimes (56 percent) as well as all personal crimes of violence (57 percent) occurred during the daytime between 6 a.m. and 6 p.m. Of the personal crimes occurring during evening hours, it was much more common for them to occur in the early part of the night between 6 p.m. and midnight than for them to occur between midnight and 6 a.m. Of the personal robberies and assaults, incidents involving armed offenders were about equally likely to occur during daytime and nighttime, but incidents involving unarmed offenders were more likely to occur during the day than at night.

Of the household crimes in which respondents knew the time of occurrence of the incidents, more occurred at night than during the day. However, it is difficult to establish for certain when the majority of these crimes occurred. Since about 10 percent of the sample did not know when the burglaries and household larcenies occurred in their homes. (It is not surprising that some victims did not know the time of occurrence of these crimes, because they may have taken place while they were away from the home for an extended period of time.) The pattern for motor vehicle theft is more definite: approximately twice as many occurred between 6 p.m. and 6 a.m. as during the daylight hours.

PLACE OF OCCURRENCE

Besides influencing the deployment of law enforcement resources, knowledge concerning the types of settings in which crimes occur can affect citizen mobility and behavior. For certain crimes not involving victim-offender contact, moreover, the classification of incidents is determined solely on the basis of their place of occurrence. Thus, by definition, the vast majority of household burglaries recorded by the National Crime Survey in Compton occurred at principal residences, with a small percentage being perpetrated at second homes or at places, such as hotels or motels, occupied by household members temporarily away from home.

On the other hand, personal crimes can occur almost anywhere individuals congregate--in their own residences,

in other private dwellings, in public buildings, on the street, in parks or playgrounds, or in the course of travel. Incidents reported in the survey were grouped into six main categories, two of which pertained to the respondent's home and its immediate vicinity. Other categories used were inside a nonresidential building; inside a school; on the street or in a park, playground, schoolground, or parking lot; and a residual category, covering places such as vacation lodgings or other temporary living quarters not belonging to the victim. 5/

5/ For purposes of brevity, the category "on the street or in a park, playground, schoolground, or parking lot" is referred to by phrases such as "on the street or in other outdoor areas" and "on the street or elsewhere outdoors."

The majority of personal crimes of violence occurred on the street or in other outdoor areas. Those occurring between persons who knew each other were more likely to occur in or near victims' homes than were those involving strangers. Within particular categories of personal violent crime, rapes were equally divided between those occurring inside or near victims' homes and those occurring on the street, in a park, or in other outdoor areas. About 7 in 10 robberies occurred on the street or in other outdoor areas; about 2 in 10 happened in or near victims' homes; the remaining 1 in 10 happened in nonresidential buildings, schools, or elsewhere. Assaults were less likely than robberies to have occurred on the street or in outdoor areas, with about half having occurred there. About 30 percent of assaults occurred in or near victims' homes, while the remaining 15 percent happened in nonresidential buildings, schools, or elsewhere.

Household larceny by definition occurs in or near victims' homes. Half of the personal larcenies involving contact (purse snatching and pocket picking) occurred on the street or in other outdoor areas, and about one-third happened inside non-residential buildings. About two-thirds of personal larcenies without contact took place on the street or elsewhere outdoors, with the remainder occurring in nonresidential buildings, schools or elsewhere.

About 6 in 10 motor vehicle thefts occurred when the vehicles were parked on the street or in outdoor areas away from the victims' residences; 3.5 in 10 motor vehicles stolen were taken while parked at victims' homes.

USE OF WEAPONS

Generally regarded among the most fearsome and potentially injurious of personal victimization experiences, criminal attacks by armed offenders can occur in a variety of circumstances and involve weapons of many kinds. For incidents involving three of the crimes measured by the National Crime Survey--rape, robbery of persons, and assault, a determination was made of whether the offenders employed weapons and, if so, the type of weapons used. For personal crimes of violence, the survey recorded the type but not the number of weapons observed by victims during an incident. If, for example, two firearms and a knife were used by offenders during a personal robbery, the incident was recorded as one in which weapons of each type were used. In types of weapons, the term "other" refers to objects such as clubs, stones, bricks, and bottles.

Weapons of some type were used in slightly more than half (52 percent) of all personal crimes of violence. Of the crimes of violence in which weapons were used, firearms were used in one-half of the incidents, knives in almost one-quarter, "other" weapons in almost one-quarter, and the type of weapon used was unknown in the remaining 5 percent.

There was no significant difference in the use of weapons of some kind between personal crimes of violence involving strangers and those involving nonstrangers. But, in the incidents in which weapons of some kind were used, firearms were more likely to be used in incidents between strangers than between nonstrangers. Firearms were used in slightly more than half of the incidents in which a weapon was used in incidents between strangers, compared with about one-third of the nonstranger incidents.

PHYSICAL INJURY TO VICTIMS OF PERSONAL CRIMES OF VIOLENCE

Physical injury occurred to the victims of personal crimes of violence in about 28 percent of all victimizations. Females were more likely than males to have sustained physical injuries, with about one-third of all female victims compared with one-fourth of all male victims receiving injuries. Victimization between persons who knew each other resulted in injury more often than those involving strangers. Whites sustained injury somewhat more often than blacks. Apparent differences between percentages of persons of different ages and incomes who were injured were not statistically significant.

In cases in which medical expenses were known, victims incurred some medical expenses in 11 percent of all personal crimes of violence. Of the victims who were injured in these crimes, 72 percent had health insurance coverage or were eligible for public medical services.

Victims received some hospital care in 11 percent of all victimizations from personal crimes of violence. Of those victims receiving hospital care, three-fourths required emergency room treatment only; the remaining one-fourth were admitted as inpatients.

ECONOMIC LOSSES

In this section of the report and in the relevant data tables, the term "economic loss" applies to the theft and/or damage of property resulting from completed crimes and the damage of property associated with attempted crimes. "Property" includes both cash and other items of all kinds. Data on the measurement of loss include references to items reported by respondents as having no monetary worth, including trivial, truly valueless objects and those having considerable sentimental or intrinsic importance. The term "recovery" is used in the context of compensation for or restoration of theft losses from any source or by any means -- whether retrieved by the victim, returned by the police, returned by some benefactor, or paid for through insurance coverage. Although the survey measured recoveries by any of these methods, it was designed to identify only one of them--compensation through insurance.

Economic Losses for Personal and Household Crimes

Economic losses occurred in 68 percent of all personal victimizations (excluding assault, since assaults resulting in theft were classified as robberies). About 6 in 10 personal victimizations involved some theft loss and 2 in 10 involved some loss from property damage. Crimes of violence resulted in economic loss less often in 4 out of every 10 victimizations. Of the personal crimes of violence, robbery was more likely to result in economic loss than rape. Personal crimes of theft resulted in some economic loss in 94 percent of the victimizations.

Household crimes, in which theft is often the motive, also resulted in economic loss in a great majority (93 percent) of victimizations. By definition, all completed larcenies and completed motor vehicle thefts resulted in economic loss.

Monetary Value of Economic Losses

For all personal crimes, the monetary value of the property fell between \$10 and \$49 in almost one-third of victimizations. In about one-fifth of the victimizations, the value of the property taken was less than \$10. For the remaining 18 percent of victimizations, slightly less than half involved property worth \$250 or more, whereas the remainder involved victimizations in which no monetary value was attached to the loss or the monetary value was unknown.

Among the household crimes, the majority (70 percent) of automobile thefts involved economic losses of \$250 or more. Almost two-thirds of household burglaries involved economic losses in the categories of \$50-\$249 and \$250 or more. For household larcenies, three-fourths of the losses fell in the categories of \$10-\$49 and \$50-249.

Recovery of Loss

Of theft losses in personal crimes, none of the loss was recovered in the great majority (87 percent) of victimizations; all of the loss was recovered in 5 percent part of the loss was recovered in 8 percent.

None of the loss was recovered in 79 percent of household crimes victimizations. Although victimizations in which none of the loss was recovered occurred less often for household victimizations than for personal victimizations, the majority of victims in both types of crimes were not able to recover their economic losses.

There were no significant differences between black and white victims in the extent to which they were able to recover their economic losses for either personal or household crimes.

For both personal and household crimes, the method of recovery of economic losses usually was by methods other than insurance coverage.

TIME LOST FROM WORK

Individuals who are injured during a criminal attack and become incapacitated as well as those who sustain economic losses and personal inconveniences related to criminal events, may have to forgo working for a time. In addition to these medical reasons, victims may have to suspend their work to attend to such matters as the filing of police reports, preparation of insurance claims, and replacement of stolen or damaged property. For each relevant crime, the National Crime Survey in Compton gauged the extent to which members of a

victimized household lost worktime in the aftermath of the victimization. Although it can be assumed that for most personal crimes of violence it was the victim who lost time from work, the survey did not record the identity of the household member concerned.

Some loss of time from work was reported in 7 percent of all personal crimes. Among persons reporting time lost from work because of victimizations, almost three-fifths reported losses of between 1 and 5 days, one fifth lost less than a day, and the remaining one fifth lost 6 days or more.

For household crimes, proportionately more respondents who were victimized (11%) reported loss of time from work than for personal crimes. Of the household crimes, the most time was lost by victims of completed automobile theft, with about one-fourth of all these respondents reporting loss of work time by a member (or members) of the victimized household.

OFFENDERS IN PERSONAL CRIMES OF VIOLENCE

The accuracy of descriptions of offenders depends upon the observational powers of the victim. The crime may have occurred in the dark; it may have happened very quickly; the victim was probably under stress when it occurred. Also, if a victim is uncertain about the characteristics of an offender, doubts may be resolved by drawing upon preconceived ideas about who usually commits crimes. These factors distorting the accuracy of information given by a respondent to an interviewer in a victimization survey should be kept in mind when interpreting data about offenders.

NUMBER OF OFFENDERS

Slightly more than half (52 percent) of all violent crimes against Compton residents involved more than one offender. These figures contrast with statistics for the Nation as a whole for 1973 in which the majority (64 percent) of violent crimes involved only one offender. These data may reflect a prevalence of gang activity, a problem in many urban areas.

Robbery was more likely than either assault or rape to have involved more than one offender. Half of all assaults and about 9 in 10 rapes involved only one offender, while almost 7 in 10 robberies involved multiple offenders.

Crimes of violence occurring between persons who knew each other were more likely to involve only one offender than those occurring between strangers. About two-thirds of personal crimes of violence in which the victim knew the offender(s) involved only one offender, compared with about one-third of personal violent crimes occurring between strangers.

In a vast majority of violent crimes, the offenders were perceived by their victims to be black. This finding is not surprising, since in the 1970 census about 70 percent of the population of Compton was black. In 89 percent of the victimizations involving a single offender, offenders were reported to be black. All of the offenders were reported to be black in 85 percent of the victimizations in which more than one offender was involved. Black victims reported being victimized by black offenders significantly more often than did white victims for victimizations involving single offenders. The pattern is less clear for multiple offenders, since some of the crimes were committed by mixed racial groups.

That crime by young persons is a problem in Compton, as in many other cities, is reinforced by data from the victimization survey. About half of the offenders in victimizations involving both single and multiple offenders were perceived by their victims to be under 21 years of age.

Young victims of single-offender crimes reported being victimized by young persons significantly more often than did victims of other ages. Three-fourths of the victims between the ages of 12 and 19 were victimized by offenders perceived to be under age 21, whereas the majority of victims in age categories of 20 to 65+ were victimized by offenders they perceived as being over age 20. In victimizations involving multiple offenders, the pattern was not as clear, since some victimizations involved offenders of mixed age groups.

VICTIM-OFFENDER RELATIONSHIP IN PERSONAL CRIMES OF VIOLENCE

Personal crimes of violence usually were committed by offenders who did not know their victims. The offender was a stranger to the victim in three-fourths of the cases. For each specific violent crime (rape, robbery, assault), the majority of victimizations also occurred between strangers. Of the three crimes, robbery was the most likely to involve strangers and assault the least likely, with rape midway between.

Variables in which significant differences occurred in the victim-offender relationship were sex, race, and marital status. Males were relatively more likely to be victimized by strangers than females, whites were more often victimized by strangers than were blacks. Married and widowed persons were more often victimized by strangers than never-married, separated, and divorced persons. There were also significant differences between some age and income categories, but there were no trends. There seemed to be some tendency for persons over age 35 to be victimized by strangers relatively more often than younger persons. The majority of people in EVERY category, though, regardless of sex, race, marital status, age or income were victimized by strangers.

Crime statistics are of course based on the tabulation of incidents which people regard as crimes and are willing to report to police and/or survey interviewers. Personal violence between family members or friends, although meeting a legal definition of a crime, cannot be recorded in victimization statistics if those involved do not regard it as a crime or are unwilling to report it to a survey interviewer.

REPORTING OF VICTIMIZATIONS TO POLICE

Crimes Against Persons

Victimization surveys make it possible to obtain information about crimes that is not reflected in police statistics. Nationally in 1974, only 47 percent of all personal crimes of violence were reported to the police, according to data from the National Crime Survey. 6/

In Compton the figures for the period October 1973 through September 1974 were about the same as for the Nation as a whole, with 46 percent of all personal violent crimes reported to the police. Crimes involving violence or the threat of violence were more likely to be brought to the attention of police than were personal crimes of theft. Still, crimes of violence were reported to the police less than half of the time.

6/ These data are based upon reports from victims and have not been verified from police records.

Within particular categories of crime, robbery with injury was reported more often than robbery without injury and aggravated assault was reported more often than simple assault. Purse snatching was more likely to be reported than pocket picking.

Females were more apt than males to report personal crimes of violence to the police. Persons between the ages of 12 and 19 reported personal crimes less often than those in older age categories. However, there was no significant difference between reporting rates for blacks and whites. The relationship of victim and offender also had no apparent effect on the proportion of crimes reported. Victimizations between persons who knew each other were just as likely to be reported as those between strangers.

The most common reasons given for not reporting personal crimes to police were that nothing could be done about the offenses and that they were not important enough to report. These responses accounted for two-thirds of reasons given for not reporting personal crimes of theft and half of the reasons for not reporting violent crimes. Other reasons were that the victim regarded the crime as a private or personal matter, that police would not want to be bothered, that the crime had been reported to someone else, that the victim feared reprisal, and that reporting was too inconvenient or time consuming. The percentages of victims giving some of these responses was very small.

Crimes against households

Household crimes, which often have some impact on everyone living in the household, were more likely to be brought to the attention of police than personal crimes in which a single individual was the victim. The more serious household crimes (burglary and motor vehicle theft) were more likely to be reported than the less serious household crime (household larceny). This pattern was similar to that for personal victimizations in which crimes of violence were reported relatively more often than personal larcenies.

Among the particular types of household crime, the more serious forms were more often reported. For example, completed motor vehicle thefts were almost always reported (93 percent), whereas attempted automobile thefts were reported only one-fourth of the time. Burglary involving forcible entry was reported in more than three-fourths of victimizations, whereas cases in which the offender entered households without force were reported less than half the time (44 percent). Household larcenies in which property and/or cash valued at \$50 or more was taken were more likely to be reported than those involving losses of less than \$50.

The reasons given for not reporting household crimes to the police were similar to those given for not reporting personal crimes.

DETAILED FINDINGS--CRIMES AGAINST COMMERCIAL ESTABLISHMENTS

The data on crimes against Compton's business community differ from those for the personal and household sectors in that they are based upon a complete census of the city's businesses, whereas the personal and household information is based upon a household sample survey. Thus, the commercial data are not subject to sampling error, although they are affected by the same types of nonsampling error as other survey and census data. A complete census was taken in Compton because of the manageably small number of businesses.

The commercial data measure only incidents of robbery and burglary occurring during the 12 months preceding the survey interviews (September 1, 1973, through August 31, 1974). Other types of commercial crime (such as employee theft, shoplifting, and vandalism) were not included in the survey.

The definitions of robbery and burglary are the same as for the other two sectors, except that the victim is a commercial establishment rather than an individual or household. Commercial burglary involves unauthorized or forcible entry into a business. Commercial robbery, like other types of robbery, involves personal confrontation and the threat or use of force.

Amounts and Rates of Victimization

A total of 1,176 commercial burglaries and robberies occurred in Compton during the reference period. Of these, 80 percent were burglaries, of which 55 percent were completed and 25 percent were attempted. The remaining 20 percent of the commercial crimes were robberies; 14 percent completed and 6 percent attempted.

The rates of victimization for the two commercial crimes in Compton were very high compared with national figures. The victimization rate for burglary was 748 victimizations per 1,000 establishments, compared with a rate of only 226 for the Nation in 1974. There were 186 robberies per 1,000 establishments in Compton, compared with 39 per 1,000 for the United States in 1974.

Among the various types of commercial establishments, retail businesses had the highest victimization rates for both burglary (993) and robbery (313). Wholesale businesses had the second highest rates for both crimes. The burglary rate for wholesale businesses (921) was almost as high as that for retail establishments, whereas the robbery rate for wholesale companies (171) was somewhat lower than for retail stores. Service establishments and businesses classified as "other" had the lowest rates, although their rates were still high. Burglary rates for service establishments were 605 per 1,000 and robbery rates were 103. For "other" establishments the rates were: burglary (567) and robbery (145).

CONTINUED

1 OF 4

Victimization rates computed on the basis of gross annual receipts were lowest for businesses with no sales and businesses with gross annual receipts of less than \$10,000.

Although the victimization rates for commercial establishments in Compton were high when compared to national rates, businesses were not equally affected, since some may have been victimized several times and others not at all. The majority of all businesses in Compton (62 percent) were not victimized during the reference period.

When examined by type of business, almost half the wholesale businesses (49 percent) and retail businesses (48 percent) were victimized at least once during the reference period. The percentages were lower for other types with 30 percent of service firms and 29 percent of businesses classified as "other" having been victimized at least once.

Time of Occurrence

Commercial burglary, a crime of stealth, usually (83 percent) took place at night (6 p.m. to 6 a.m.), when the risk that the burglar would encounter someone on the business premises was reduced. On the other hand, commercial robberies, which by definition involve personal encounters, were more likely to occur during normal business hours of 6 a.m. to 6 p.m. (61 percent) or between 6 p.m. and midnight (27 percent).

Economic Losses

About 86 percent of the measured commercial crimes resulted in some economic loss to the business, from theft of property, damage to property, or both. Of the victimized establishments, 58 percent suffered some theft loss and 62 percent some loss from damage to property.

Economic loss of some sort occurred more often in commercial burglaries (90 percent) than in commercial robberies (74 percent). Economic loss due to property damage occurred much more often in burglaries (73 percent) than in robberies (15 percent), whereas theft loss occurred more frequently in robberies (69 percent) than in burglaries (56 percent).

Economic loss occurred in only half of the robberies in service establishments; comparable figures for other business types were three-fourths of wholesale businesses and "other" establishments and 82 percent of retail businesses. The differences between the types of establishments were less pronounced in burglaries. Percentages of burglary victimizations in which economic loss occurred ranged from 83 percent for wholesale companies to 91 percent for retail firms.

Almost two-fifths of the burglaries (39 percent) and robberies (37 percent) involved economic losses valued at \$251 or more; 85 percent of robberies and 62 percent of burglaries involved losses of at least \$51; only 1 percent of robberies and 16 percent of burglaries involved losses of less than \$10.

It was uncommon for property lost from theft in commercial crimes to be recovered. No property was recovered in 90 percent of burglaries and 87 percent of robberies. Some of the property was recovered in 6 percent of burglaries and 7 percent of robberies, and all of the property was recovered in only 3 percent of burglaries and 6 percent of robberies.

Time Lost From Work

Fifteen percent of commercial robbery victimizations and 8 percent of commercial burglary victimizations resulted in some loss of time from work as a result in some loss of time from work as a result of the victimizations. In robbery, 10 percent of the victimizations resulted in the loss of 1 day or more of working time while the other 5 percent of victimizations resulted in less than a day of lost worktime, and only 3 percent involved the loss of a day or more.

Reporting of Crimes to Police

Commercial crimes, unlike personal crimes, generally were well reported to the police: 90 percent of all commercial robberies and 80 percent of all commercial burglaries were reported.

Use of Weapons

Weapons of some type were used in 72 percent of all commercial robberies. The most common weapon used was a firearm (59 percent); knives (3 percent) and other weapons (10 percent) were used relatively infrequently. Weapons of all types were more often used in completed robberies (74 percent) than in attempted robberies (66 percent). Firearms were more often used in completed robberies (65 percent) than in attempted ones (43 percent), whereas the reverse was true for other types of weapons. Both knives and other weapons were used more frequently in attempted robberies (8 percent and 15 percent) than in completed ones (1 percent and 8 percent).

Table 1. Personal, household, and commercial crimes: Number and percent distribution of victimizations, by sector and type of crime

Aggravated assault	100	70	13	3	13	10
Simple assault	100	71	4	11	14	10

NOTE: Detail may not add to total shown because of rounding.

Z Less than 0.5 percent.

¹Estimate, based on zero or on about 10 or fewer sample cases, is statistically unreliable.

Table 50. Personal crimes of violence: Percent of incidents in which offenders used weapons, by type of crime and victim-offender relationship

Type of crime	All incidents	Involving strangers	Involving nonstrangers
Crimes of violence	52	53	48
Rape	40	50	10
Robbery	52	51	53
Robbery with injury	58	56	50
Robbery without injury	50	49	56
Assault	53	55	48
Aggravated assault	98	100	93

¹Estimate, based on about 10 or fewer sample cases, is statistically unreliable.

²Includes data on simple assault, which by definition does not involve the use of a weapon.

Table 51. Personal crimes of violence: Percent distribution of types of weapons used in incidents by armed offenders, by victim-offender relationship, type of crime, and type of weapon

Relationship and type of crime	Total	Firearm	Knife	Other	Type unknown
All incidents					
Crimes of violence	100	50	22	23	5
Rape	100	33	33	33	10
Robbery	100	47	26	22	4
Robbery with injury	100	26	26	39	9
Robbery without injury	100	58	27	13	12
Aggravated assault	100	53	18	24	5
With injury	100	25	17	54	14
Attempted assault with weapon	100	63	18	14	6
Involving strangers					
Crimes of violence	100	52	19	23	5
Rape	100	33	33	33	10
Robbery	100	48	50	22	5
Aggravated assault	100	57	13	24	6
Involving nonstrangers					
Crimes of violence	100	32	32	32	14
Rape	10	10	10	10	10
Robbery	100	56	22	22	10
Aggravated assault	100	21	37	37	15

NOTE: Detail may not add to total shown because of rounding.

¹Estimate, based on zero or on about 10 or fewer sample cases, is statistically unreliable.

Table 52. Commercial robbery: Percent of incidents in which offenders used weapons, by type of crime and type of weapon

Type of crime	All types	Firearm	Knife	Other
Robbery	72	59	3	10
Completed robbery	74	65	6	8
Attempted robbery	66	43	8	15

NOTE: The data are based solely on weapons of types recognized by persons on the scene at the time of the incident. For each robbery in which more than one weapon was used, the identity of only the most lethal kind of weapon was recorded. Thus, the sum of the proportions of recognized types of the three categories of weapons equals the proportion of incidents in which weapons were used. Detail may not add to total shown because of rounding.

Table 53. Personal crimes of violence: Percent of victimizations in which victims sustained physical injury, by selected characteristics of victims and type of crime (excluding rape)

Appendix 1

NCS CITIES SAMPLE IN COMPTON, CALIFORNIA

Sample Design, Estimation Procedure, and Reliability of the Estimates.

Sample Design and Size

- (a) Personal Sector. The basic frame from which the sample was drawn for the personal sector of the Crime Victimization Survey in Compton, California, was the complete housing inventory for the city, as determined by the 1970 Census of Population and Housing. For the purpose of sample selection, all records on the 100 percent Edited Detail File were sorted by type of record, i.e., regular housing units or group quarters. Within each of those two strata, records were sorted by Enumeration, District and Census serial numbers. To account for residential housing units built after the 1970 Census, a sample was drawn of permits issued for the construction of new buildings in the city. This allowed for the proper representation in the survey of persons occupying housing units built since 1970.

Approximately 8,200 housing units were designated for the sample. Of these, about 1,600 were visited by interviewers during the survey period but were found to be vacant, demolished, temporarily occupied by nonresidents, or otherwise unqualified for interview. In addition, at some 400 other units visited by interviewers, it was impossible to conduct interviews because the occupants could not be contacted after

repeated calls, did not wish to participate in the survey, or were unavailable for other reasons. Thus, the number of households where interviews were taken was roughly 6,300 and the overall rate of participation, or response, among households qualified for interview was about 94 percent.

- b. Commercial Sector. For the commercial sector of the Compton Crime Victimization Survey a complete census of commercial establishments was taken. The census was taken instead of a sample because of the manageable size of the commercial universe in Compton. In order for a business establishment to be enumerated, the operations had to be at a permanent facility, such as a permanent building or a permanent vending stand. Establishments excluded from the census were business engaged in agricultural production, government buildings (except government owned liquor stores and transportation establishments), unrecognizable businesses conducted in private homes, construction sites, unattended coin operated businesses and no-charge (free) facilities.

Approximately 1700 commercial establishments were designated for the census. Of these, 453 were visited by interviewers during the survey period but were found to be vacant, demolished, occupied by a non-listable establishment or otherwise unqualified for interview. In addition, at some 37 units interviews could not be conducted because the owner could not be contacted after repeated calls, did not wish to participate in the survey, or was unavailable for other reasons. Thus, interviews were taken in 1,206 establishments, and the overall rate of response among those qualified to participate was 97 percent.

Estimation

(a) Personal Sector. Data records generated by the survey interviews for the personal sector were assigned two sets of final tabulation weights - one for crimes against persons and another for crimes against households. For interviews conducted at housing units selected from the Census housing inventory and sample units built since 1970, the following factors determined the final tabulation weights for crimes against persons:

- (1) A basic weight, reflecting the selected units' probability of being included in the sample;
- (2) A duplication control, which compensated for the subsampling of units, a situation which arose in instances where the interviewer discovered many more units at the address designated for sample than had been listed in the 1970 Census;
- (3) A within household noninterview factor, to account for situations where at least one but not all eligible persons in a household were interviewed;
- (4) A household noninterview factor to adjust for occupied housing units qualified to participate in the survey but where an interview was not obtained;

- (5) A household ratio estimate factor for bringing estimates developed from the sample of 1970 housing units into accord with the complete Census count of such units. (This step did not apply to data records gathered from residents of group quarter or residents occupying housing units constructed after the 1970 Census.) And;
- (6) A person ratio estimate factor for bringing the survey-derived estimates into agreement with an independent post-Census estimate of the population age 12 and over.

The final weight used in tabulating estimates of criminal incidents against persons was the product of the six factors described above, plus an adjustment for incidents involving more than one person, thereby allowing for the probability that such incidents might have had more than one chance of coming into sample. For estimates pertaining to personal victimizations, the final tabulation weight was the product of the six factors described above.

For household crimes, the final tabulation weight was the product of all steps described above except the third and sixth steps, i.e., the within-household noninterview adjustment and the person-ratio estimate were not factors in weighting the household data records. The household and person ratio estimate factors were key steps in the weighting procedures for crimes against persons because they reduced the sampling variability, thereby reducing the margin of error in the tabulated results. The household ratio estimate factor

also compensated for the exclusion of any households that were already included in samples for other Census Bureau programs.

(b) Commercial Sector. For the commercial sector, the data records were assigned composite weights which consisted of the product of some or all of the following three components:

- (1) A sample weight which is the inverse of the probability of selection. In this case, the basic weight for each establishment was one, since a complete census rather than a sample was taken.
- (2) An imputation factor to compensate for missing information in reports or unusable reports.
- (3) A part year imputation factor to handle incidents for establishments which were in business only part of a year.

Reliability of the Estimates

The sample that was used in the household survey was only one of a large number of possible samples of the same size that could have been selected using the same sample design and sample selection procedures. Estimates derived from these different samples would differ from each other. The standard error of a survey estimate is a measure of the variation among the estimates from all possible samples and is, therefore, a measure of the precision with which an estimate from a particular sample approximates the

average result of all possible samples. As calculated for this report, the standard error also partially measures the effect of certain nonsampling errors but does not measure any systematic biases in the data. A sample estimate and its associated standard error may be used to construct a confidence interval, that is, an interval having a prescribed probability that it would include the average result of all possible samples. The chances are about two out of three (about 68 percent) that the survey estimate will differ from the average result of all possible samples by less than one standard error (plus or minus). Similarly, the chances are about 19 out of 20 that the difference would be less than twice the standard error and 99 out of 100 that the difference would be less than 2 1/2 times the standard error.

In addition to sampling error, the survey results presented in this report for both the household survey and commercial census are subject to nonsampling errors. A major source of nonsampling error is the incorrect reporting by respondents of data or experience relevant to the reference period. Other nonsampling errors result from incomplete responses during interview, mistakes introduced by interviewers, and improper coding and processing of data.

Standard errors displayed on tables of this report cover crimes against persons and households. They are rough approximations and suggest an order of magnitude of the standard errors rather than the precise error associated with any given value.

Table 1 contains the standard errors pertaining to estimated numbers of personal victimizations, personal incidents, and household victimizations. Tables 2-4 display standard errors for personal victimization rates, personal incident rates and household victimization rates, respectively.

For estimated levels and rates not specifically listed on a table, linear interpolation must be used to calculate the standard errors.

Illustrations on the Use of the Standard Error Tables

To illustrate how to use the standard error tables, assume that one of the detailed data tables in this report shows there were 4,200 robbery victimizations in the city of Compton. Estimates of this type are considered personal victimizations, and their standard errors are displayed in Table 1. Linear interpolation in this table shows the standard error on an estimate of this size to be approximately 112. The chances are 68 out of 100 that the estimate 4,200 would differ from a figure obtained from a complete census by less than 112, i.e., the 68 percent confidence interval would be from 4,088 to 4,312. The 95 percent confidence interval would be from 3,976 to 4,424 ($4,200 \pm 2 \times 112$).

Assume further that the personal victimization rate for assault was estimated to be 11 per 100 persons for females age 12 and over, and that the base for this rate is 30,000 females. Two way linear interpolation of the data in Table 2 gives a standard error on an estimate of this size of about 0.24. Consequently, chances are 68 out of 100 that the estimated rate

of 11 per 100 would be within 0.24 of a complete census figure, i.e., the 68 percent confidence interval would be from 10.76 to 11.24. The chances are 95 out of 100 that the estimated rate would be within 0.48 of a complete census figure, i.e., the 95 percent confidence interval would be from 10.52 to 11.48 ($11 \pm 2 \times .24$).

4

For the difference between two sample estimates, the standard error is approximately equal to the square root of the sum of the squares of the standard error of each estimate considered separately. This formula will represent the actual standard error quite accurately for the difference between separate and uncorrelated characteristics. If, however, there is a high positive correlation between the two characteristics, the formula will overestimate the true standard error. An example of the use of the formula is as follows:

Suppose that a data table showed that 1,000 of the recorded personal victimizations were simple assaults and 2,200 were robberies without injury. The standard errors for each of these estimates are 45 and 72, respectively. The standard error of the estimated difference of 1,200 is about $85 \pm \sqrt{(45)^2 + (72)^2}$. This means the chances are 68 out of 100 that the estimated difference based on the sample would differ from a value derived using complete census figures by less than 85. The 68 percent confidence interval around the difference 1,200 is from 1,115 to 1,285, i.e., $1,200 \pm 85$. The 95 percent confidence interval would be from 1,030 to 1,370, i.e., $1,200 \pm 2 \times 85$. Thus, we can conclude with 95 percent confidence that the difference between the two characteristics is significant.

Annual family income-includes the income of the household head and all related persons residing in the same household unit. Covers the 12 months preceding the interview and includes wages, salaries, net income from business or farm, pensions, interest, dividends, rent, and any other form of monetary income. The income of persons unrelated to the head of household is excluded.

Assault-An unlawful physical attack, whether aggravated or simple, upon a person. Includes attempted assaults with or without a weapon. Excludes rape and attempted rape, as well as attacks involving theft or attempted theft, which are classified as robbery.

Attempted forcible entry-A form of burglary in which force is used in an attempt to gain entry.

Burglary-Unlawful or forcible entry of a residence or business, usually but not necessarily attended by theft. Includes attempted forcible entry.

GLOSSARY

Age- appropriate age category is determined by the respondent's age as of the last day of the month preceding the interview.

Aggravated assault-Attack with a weapon resulting in any injury and attack without a weapon resulting either in serious injury (e.g., broken bones, loss of teeth, internal injuries, loss of consciousness) or in undetermined injury requiring 2 or more days of hospitalization. Also includes attempted assault with a weapon.

Commercial crimes-Burglaries or robberies of business establishments and certain other organizations; such as those engaged in religious, political, or cultural activities. Includes both completed and attempted acts.

Forcible entry-A form of burglary in which force is used to gain entry (e.g., by breaking a window or slashing a screen).

Head of household-For classification purposes, only one individual per household can be the head. In husband-wife households, the husband arbitrarily is considered to be the head. In other households, the head is the individual so regarded by its members, generally the chief breadwinner.

Household-Consists of the occupants of separate living quarters meeting either of the following criteria; Persons, whether present or temporarily absent, whose usual place of residence is the housing unit in question or persons staying in the housing unit who have no usual place of residence elsewhere.

Household crimes-burglaries or larcenies of residence's or motor vehicle thefts. Includes both completed and attempted acts.

Household larceny-theft or attempted theft of property or cash from a residence or its immediate vicinity. Forcible entry, attempted forcible entry, or unlawful entry are not involved.

Incident-A specific criminal act involving one or more victims and offenders.

When a personal crime occurred during the course of a commercial burglary or robbery, it was assumed that the commercial victimization survey accounted for the incident and, therefore, it was not counted as an incident of personal crime. However, details of the outcome of the event as they related to the victimized individual would be reflected in data on personal victimizations.

Kind of establishment-Determined by the sole or principal activity at each place of business.

Larceny-Theft or attempted theft of property or cash without force. A basic distinction is made between personal larceny and household larceny.

Marital status-Each household member is assigned to one of the following categories:

Married, which includes persons having common-law unions and those parted temporarily for reasons other than marital discord (employment, military service, etc.), Separated and divorced; separated includes married persons who have a legal separation or have parted because of marital discord, Widowed, and

Never married, which includes those whose only marriage has been annulled and those living together (excluding common-law unions).

Motor vehicle-Includes automobiles, trucks, motor cycles, and any other motorized vehicles legally allowed on public roads and highways.

Motor vehicle theft-Stealing or unauthorized taking of a motor vehicle including attempts at such acts.

Nonstranger-With respect to crimes entailing direct contact between victim and offender, victimizations (or incidents) are classified as having involved nonstrangers if victim and offender are related, well known to, or casually acquainted with each other. In crimes involving a mix of stranger and nonstranger offenders, the events are classified under nonstranger. The distinction between stranger and nonstranger crimes is not made for personal larceny without contact, an offense in the victim rarely see the offender.

Offender-The perpetrator of a crime. The term generally is applied in relation to crimes entailing contact between victim and perpetrator.

Offense-A crime. With respect to personal crimes, the two terms are interchangeable regardless of whether the applicable unit of measure is a victimization or an incident.

Personal crimes-Rape, robbery of persons, assault, personal larceny with contact, or personal larceny without contact. Includes both completed and attempted acts.

Personal crimes of theft-Theft's of property or cash, either with contact (but without force or threat of force) or without contact between victim and offender. Equivalent to personal larceny.

Personal crimes of violence-Rape, robbery of persons, and assault. Includes both completed and attempted acts.

Personal larceny-Equivalent to personal crimes of theft. A distinction is made between personal larceny with contact and personal larceny without contact.

Personal larceny with contact-Theft of purse, wallet, or cash by stealth directly from the person of the victim but without force or the threat of force. Also includes attempted purse snatching.

Personal larceny without contact-Theft or attempted theft, without direct contact between victim and offender, of property or cash from any place other than the victim's home or its immediate vicinity. In rare cases, the victim sees the offender during the commission of the act. Also includes attempted theft.

Race-Determined by the interviewer upon observation and asked only about persons unrelated to the head of household who are not present at the time of interview. The racial categories distinguished are white, black, and other.

Rape-Carnal knowledge through the use or the threat of force, including attempts. Statutory rape without force is excluded. Includes both heterosexual and homosexual rape.

Rate of victimization-See Victimization rate.

Robbery-Theft or attempted theft, directly from a person or a business, of property or cash by force or threat of force, with or without a weapon.

Robbery with injury-Theft or attempted theft.

from a person accompanied by an attack, either with or without a weapon, resulting in injury. An injury is classified as resulting from a serious assault if a weapon were used in the commission of the crime or, if not, when the extent of the injury was either serious (e.g., broken bones, loss of teeth, internal injuries, loss of consciousness) or undetermined but requiring 2 or more days of hospitalization. An injury is classified as resulting from a minor assault when the extent of the injury was minor (e.g., bruises, black eye, cuts, scratches, swelling) or undetermined but requiring less than 2 days of hospitalization.

Robbery without injury-Theft or attempted theft

from a person accompanied by force or the threat of force, either with or without a weapon, but not resulting in injury.

Simple assault-Attack without a weapon resulting either in minor injury (e.g., bruises, black eye, cuts, scratches, swelling) or in undetermined injury requiring less than 2 days of hospitalization. Also includes attempted assault without a weapon.

Stranger-with respect to crimes entailing direct contact between victim and offender, victimizations (or incidents) are classified as involving strangers if the victim so stated, did not see or recognize the offender, or knew the offender only by sight. Crimes involving a mix of stranger and nonstranger offenders, are classified under nonstranger. The distinction between stranger and nonstranger crimes is not made for personal larceny without contact, an offense in which victims rarely see the offender.

Tenure-Two forms of household tenancy are distinguished: Owned, which includes dwellings being bought through mortgage, and rented, which also includes rent-free quarters belonging to a party other than the occupant and situations in which rental payments are in kind or in services.

Unlawful entry-A form of burglary committed by someone having no legal right to be in the premises even though force was not used.

Victim-The recipient of a criminal act; usually used in relation to personal crimes but also applicable to households and commercial establishments.

Victimization-A specific criminal act as it affects a single victim, whether a person, household, or commercial establishment. In criminal acts against persons, the number of victimizations is determined by the number of victims of such acts; ordinarily, the number of victimizations is somewhat higher than the number of incidents both because more than one individual may be victimized during an incident and because personal victimizations that occurred in conjunction with commercial burglary or robbery are not counted as incidents of personal crime. Each criminal act against a household or commercial establishment is assumed to involve a single victim, the affected household or establishment.

Victimization rates-For crimes against persons,

the victimization rate, a measure of occurrence among population groups at risk, is computed on the basis of the number of victimizations per 1,000 resident population age 12 and over. For crimes against households, victimization rates are calculated on the basis of the number of incidents per 1,000 households.

For crimes against commercial establishments, victimization rates are derived from the number of incidents per 1,000 establishments.

Victimize-To perpetrate a crime against a person, household, or commercial establishment.

Weapon-With respect to personal crimes of violence by armed offenders, a distinction is made between firearms, knives, and weapons of "other" types, such as clubs, stones, bricks, and bottles; a fourth category covers weapons of unknown types. For each incident involving an armed offender(s), survey interviewers recorded the type or types of weapons used in the incident, not the number of weapons. For instance, if offenders wielded two guns and a knife during a personal robbery, the crime is classified as one in which weapons of each type were used.

Weapons use -For purpose of tabulation and analysis,
the mere presence of a weapon constitutes "use."
In other words, the term applies both to situations
in which weapons served for purposes of intimidation
or threat and to those in which they actually were
employed as instruments of physical attack.
