Introduction

The Juvenile Court Report presents data collected during calendar year 1979 through the Juvenile Court Reporting (JCR) System concerning young people who were processed by courts with juvenile jurisdiction in the State of Nebraska. These include 90 county courts and the three separate juvenile courts of Douglas, Lancaster, and Sarpy Counties.

The JCR system was instituted in 1971 by the Nebraska Commission on Law Enforcement and Criminal Justice (hereafter referred to as the Commission). The system is based on the Department of Health, Education and Welfare's Juvenile Court Statistics Series begun in 1927. In 1973 this system was assumed by the National Center for Juvenile Justice under a grant from the Law Enforcement Assistance Administration (LEAA), the parent agency of this Commission. The Center compiles national statistics on juvenile delinquency based on state reporting systems such as the one in Nebraska.

In Nebraska, the Commission uses data obtained through the JCR system as a basis for its function of juvenile planning. The system also proves to be a valuable source of information for any private or public agency or individual dealing with juvenile delinquency or related problems. Readers are reminded that upon request to the Commission specific information collected through the JCR system can be provided. While this report presents a wealth of data describing the characteristics of youth who enter the Nebraska court system, the report does not interpret the information beyond words of caution in the uses of the data.

The many associate county judges, court clerks, probation officers, and other court personnel deserve recognition for their time and effort exerted in reporting consistently. Without their cooperation this publication would not be possible.

Juvenile Court Reporting System

One of the primary purposes of this publication is to report, the particular measure used to estimate the degree of juvenile crime is the flow of juveniles through the Nebraska Court System (see Figure 1). The sources of the data are the three separate juvenile courts of Douglas, Lancaster, and Sarpy Counties and the county courts in the remaining 90 counties. The district courts of Nebraska do not report to the Commission nor do the two municipal courts in Omaha and Lincoln. District court cases would involve mainly older juveniles appearing for serious offenses and the number of such cases is small compared to the volume of cases handled in county courts. The Commission does not collect data on traffic offenses which comprise the bulk of juvenile referrals to municipal court along with violations of ordinances.

The 93 courts report cases disposed of to the Commission monthly. For each individual juvenile disposition, the court fills out a Juvenile Court Statistical Form shown in Figure 2. The following sections of the form are required information on all cases: A. Court Code, E. Age at Time of Referral, F. Sex, G. Ethnic Group, H. Date of Referral, L. Reason Referred, M. Manner of Handling, N. Date of Disposition, and O. Disposition. The remainder of the form is optional information, however, the courts are encouraged to include as much of the information as they possibly can. If there were no juvenile case dispositions during the month, the court submits a "No Report" card for that month.

Data were collected during calendar year 1979 on a revised Juvenile Court Statistical Form. Most of the revisions made on the form were minor and had no effect on the substance of information gathered through the system. The most significant change occurred in Section L., Reason Referred. Here, the offense categories were modified to conform with the new categories defined in the revised "Nebraska Criminal Code."

All of the data received from the courts are entered into provide information that accurately reflects the level of the computer at the State Data Processing Center. Magnejuvenile crime occurring in the State of Nebraska. In this tic tapes which contain all of the juvenile court data are constructed on a quarterly basis. These tapes are sent to Wayne State University in Detroit, Michigan, where they can be analyzed on the Michigan Terminal System (MTS). By connecting with MTS through a remote terminal hook-up at the Commission, cumulative juvenile court information including data from the most recent quarter is constantly accessible. Summary totals, crosstabulations, and statistical analyses can be performed using the sophisticated software available on MTS.

> At this time, the Commission has juvenile court data from all counties from 1974 through 1977 and some partial data from 1973. The system is lacking data from Custer County which failed to report to the Commission in 1978 and 1979.

Referrals

A juvenile can be referred to juvenile court if it appears that he or she fits into any one of the four categories described in Section 43-201 of the Nebraska Revised Statutes listed below:

(1) Dependent child shall mean any child under the age of eighteen years, who is homeless or destitute, or without proper support through no fault of his parent, guardian or custodian.

(2) Neglected child shall mean any child under the age of eighteen years (a) who is abandoned by his parent, guardian or custodian; (b) who lacks proper parental care by reason of the fault or habits of his parent, guardian or custodian; (c) whose parent. guardian, or custodian neglects or refuses to provide proper or necessary subsistence, education, or other care necessary for the health, morals, or well being of such child; (d) whose parent, guardian, or custodian neglects or refuses to provide special care made necessary by the mental condition of the child; or (e) who is in a situation or engages in an occupation dangerous to life or limb or injurious to the health or morals of such child.

(3) Delinquent child shall mean any child under the age of eighteen years who has violated any law of the state or any city or village ordinance.

(4) A child in need of special supervision shall mean any child under the age of eighteen years (a) who, by reason of being wayward or habitually disobedient, is uncontrolled by his parent, guardian, or custodian; (b) who is habitually truant from school or home; or (c) who deports himself so as to injure or endanger seriously the morals or health of himself or others.

After a case comes to the court's attention, a decision is made whether to handle the case unofficially (without petition) or officially (with petition). Most cases handled without petition are generally disposed of by the court intake staff by one of several options. Many of these options are the same as those for cases handled with petition. If it is decided to file a petition (similar to a "complaint" in an adult case) with the clerk of the court, the procedure is most often performed by the County Attorney. After a petition is filed, a hearing is conducted for the juvenile by a judge; no jury is present. The hearing proceeds in an informal manner, applying the rules of evidence used by district courts in civil trials without a jury. The judge will decide the case with one of many disposition options.

are classified into three categories: major offenses, minor offenses and neglect-dependent cases. Major offenses are coded on the Juvenile Court Statistical Form (see Figure 2)

under section L. as responses 01 through 28. The major offense referrals are typically regarded as "delinquency" offenses. Minor offense referrals are coded in categories 31 through 39. Minor offenses are often referred to as "status" offenses and represent offenses applicable only to individuals under the age of eighteen. Neglect-dependent cases are coded in responses 51 and 52.

In 1979 there were 4,458 juvenile court referrals reported to the Commission. Of these, 3,556 (79.8%) were handled with petition, while 902 (20.2%) were handled without petition. Referrals for major offense categories accounted for 64.2% or 2,862 of the total number of referrals. Minor offense referrals numbered 1,045 (23.4% of the total) and there were 551 neglect-dependency cases (12.4% of the total). Tables 1, 2, and 3 give breakdowns on the reasons for referral for major, minor and neglectdependent cases, respectively.

The fact that major offense referrals are nearly three times the frequency of minor offense referrals does not necessarily indicate that this ratio exists in the juvenile population. The major offenses are usually considered more serious since they are infractions of state or local laws while the minor offenses are offenses only because of juvenile status. Major and minor offenders are therefore most likely to be treated differently before the court stage is ever reached. Many minor offenders are handled directly by the police or diverted to various social agencies and programs and never appear in juvenile court.

The most frequent referrals for major offenses in 1979 were theft under \$100, burglary, and misdemeanor criminal mischief (vandalism) in that order. These three offenses combined account for 46.2% of the major offenses.

Major offenses can also be broken down by offense type using three broad, conventional categories of offenses against persons, offenses against property, and victimless offenses (see Table 4). Offenses against persons which include murder, manslaughter, assaults, sexual assaults and robbery comprised only 8.5% of the major offense referrals and 5.4% of all referrals. These offenses are usually considered as the "violent crimes."

Offenses against property constituted the largest proportion of both major and total referrals, 71.4% and 45.9% respectively. Offenses considered as property crimes are arson, burglary, unauthorized use of a propelled vehicle, theft, criminal mischief, and criminal trespass.

Forgery, weapons offenses, driving while intoxicated: For purposes of this report, referrals to juvenile court 3rd offense, distrubing the peace, and violation of drug laws are among the victimless offenses. Victimless offenses accounted for 9.5% of major offense referrals and 6.1% of the total referrals.

Major offenses of an unknown nature were classified as "other major offenses" and were 10.6% of the major offenses.

The major, minor, and neglect-dependent referral trends since 1974 are depicted in Figure 4. Major offense referrals in 1979 decreased slightly from 1978 by 1.2%. Although this decrease is not as substantial as the 17.3% decrease from 1977 to 1978, it continues a pattern of steady declines in the number of major referrals since 1975. The striking increase of 23.6% from 1974 to 1975 most likely reflects an improvement in reporting practices by the courts to the Commission since the complete implementation of the JCR program in 1974.

Minor offense referrals increased by 8.6% from 1978 to 1979. These referrals remained fairly stable from 1974 to 1977. A significant decrease of 18.6% occurred in 1978 possibly reflecting the recent trend toward keeping the status offender out of the juvenile court by diversion to social agencies and programs. Even though 1979 minor referrals increased 8.6% from the previous year, the number of referrals is still 9.03% lower than the average number (1,149) of referrals for the previous five year period. This suggests that diversion of status offenders from the courts is a continuing practice.

Neglect-dependent referrals have remained fairly constant since 1974. Percentage differences from year to year appear substantial due to the relatively low frequencies of neglect-dependent referrals. However, in 1979 these referrals were up 11.8% over the 1978 number and 21.2% over the mean value (455) of neglect-dependent referrals from 1974 to 1978. An upward trend in neglect-dependent referrals is suggested.

In gauging the level of activity in the juvenile justice system, comparisons of juvenile court data to juvenile arrest data and juvenile population information are useful. Juvenile arrest data were obtained through the Nebraska Uniform Crime Report (UCR) published by the Commission. Only arrests for offenses in the major referral category were considered. (A breakdown of UCR arrest data is given in Appendix B for the years 1974-1979). Nebraska school enrollment data supplied by the Nebraska Department of Education were used as an estimate of juvenile population. These data collected September 30 of every school year provide an accurate estimate for the age group 5-18 years with some error for ages 16-18 due to drop-outs. When looking only at major offense referrals, which involve very few preschoolers, this age group is a good measure of the offender population.

The frequencies and percentage changes for major court referrals, UCR juvenile arrests, and juvenile population are given in Table 5 for the years 1974-1979.

A simple correlation analysis was done on this data in order to discover any relationships existing among these dependent cases (52.2%). County attorneys also ranked second in the number of neglect-dependent referrals

three variables. Correlation analysis indicates that two or more variables vary together either positively or negatively. As previously mentioned, the substantial increase in major referrals from 1974 to 1975 most likely indicates improvement in reporting practices for 1975 compared to 1974, the first year that the program was completely instituted in all the county and separate juvenile courts. Assuming that the 1974 value for major offense referrals is spurious, 1974 data were not included in these analyses.

Positive correlations were found to be statistically significant for all relationships among the variables: UCR arrest data and major offense referrals, UCR arrest data and juvenile population, and major offense referrals and juvenile population. Refer to Table 6 for the correlation coefficients and the respective levels of significance.

These significant relationships simply mean that both the number of juveniles being arrested for major offenses and the number referred to juvenile court for these offenses have been declining over the past few years. A major factor in these decreases is possibly the decline in juvenile population.

Another way to look at the relationships among juvenile court referrals, juvenile arrest data, and juvenile population is to compare the rates of major court referrals and juvenile arrests for these offenses. Figure 5 shows rates per 1,000 juvenile population (based for school enrollment data) for major court referrals and arrests since 1974. Again, a simple correlation analysis bears out a statistically significant relationship (refer to Table 6) between these rates. While the arrest rate for major juvenile offenses is over three times higher than the juvenile court referral rate for major offenses, the significant correlation indicates that these rates are varying closely together in the same direction and degree.

Although juvenile arrests for major offenses and major court referrals are significantly related, not all major court referrals come from law enforcement agencies. In 1979 law enforcement agencies accounted for 70.4% (see Table 7) of major court referrals. Twenty percent of the juveniles arrested for major offenses in 1979 appeared in court. In 1978 this figure was 23.3% indicating that there has been a slight decrease in the number of juveniles arrested that actually reach juvenile court.

Table 7 also includes the source of referrals for all juvenile court referrals. Law enforcement agencies made the most referrals for major (70.4%), minor (44.2%), and total referrals (56.3%). County attorneys followed, referring 20.8% of the major offenses, 22.5% of the minor, and 22.6% of the total referrals. The pattern of the source of referrals for neglect-dependent cases is much different. Law enforcement agencies constituted only 6.6% of these referrals. Social agencies referred the majority of neglect-dependent cases (52.2%). County attorneys also ranked second in the number of neglect-dependent referrals

Dispositions

centages, separated into the three main categories of major, minor, and neglect-dependent referrals, are listed in Table 9.

The most frequently reported disposition of a major offense referral was formal probation constituting 42.7% of all major offense dispositions. The next most frequently reported disposition was dismissal with complaint not substantiated followed by held open without further action. This represents a change from 1978 in which the second and third most frequently reported major offense dispositions were dismissal with complaint substantiated and dismissal with complaint not substantiated respectively.

7.2% of the major offense dispositions resulted in a transfer of legal custody. Approximately one-half of these were to the Youth Development Centers in Kearney and Geneva, Nebraska.

The most frequent minor offense disposition was also formal probation (33.4%) followed by dismissal with complaint not substantiated (10.7%).

Of the 1,044 minor offense dispositions, 13.6% resulted in a transfer of legal custody. The most frequent of these were to a public agency or department.

transfer of legal custody to a public agency or department. skewness of the distribution.

The Juvenile Court disposition frequencies and per- Most likely these transfers were mainly to the Department of Welfare.

> Taking the major, minor, and neglect-dependent referrals combined, 0.7% were waived to criminal court, 16.2% were dismissed with complaint not substantiated, 68.0% were substantiated complaints with no transfer of legal custody, and 14.9% resulted in a transfer of legal

> Only 2.6% of all referrals resulted in a transfer of custody to a Youth Development Center. 44.0% of these were for burglary and theft offenses.

The differences in time, in days, between the date of referral and date of disposition are listed in Table 10 by offense. A graphic representation of this data appears in Figure 6.

5.2% of all referrals were disposed of on the same day as they were referred. This was the largest percentage for any single day. 21.3% were disposed of within 10 days of referral and 42.1% were disposed of within 30 days. 21.1% of the dispositions fell within the range of 51-100 days after referral. 18.7% occurred after 100 days.

The mean and median values for this timespan are 69.1 and 38.6 days respectively. In this instance the median is Of the neglect-dependent referrals, 42.8% resulted in a most likely a better measure of central tendency due to the

For convenience age was broken down into four range of 14 through 17 years the types of referrals were categories: 11 and under, 12-13, 14-15, and 16-17. The fairly constant. data for these categories separated by major, minor, and neglect-dependent referrals appears in Table 11.

The 11 and under age group constituted 12.8% of all referrals. A substantial majority, 67.1%, of the referrals in this age group were neglect/dependent related and this age group accounted for 69.3% of all neglect-dependent referrals.

Only 4.8% of the major offense referrals and 4.7% of the minor offense referrals involved juveniles 11 years of age and younger. The percentage of major offense referrals is not significantly different from the 1978 value of 4.4%. However, the minor offense percentage represents a 74.1% increase over the 1978 value of 2.7%. It is difficult to determine if this is a significant increase due to the small size of the absolute frequencies.

Major offense referrals were the most frequent in the oldest three age groups followed by minor offenses and neglect-dependent referrals. The 12-13 age group had a larger percentage of neglect-dependent referrals at 10.0% of the referrals for that age group compared to only 3.4% and 3.6% for the 14-15 and 16-17 age groups respectively.

The distribution of major, minor, and neglectdependent referrals within the 14-15 and 16-17 age groups increased tendency not to transfer legal custody as age inwere virtually indistinguishable indicating that over the creased.

The 16-17 age group accounted for most of the total referrals for all ages with 40.0%, followed by the 14-15 age group with 36.0%, the 11 and under group with 12.8% and the 12-13 group with 11.2%.

The disposition frequencies and percentages for the four age groups are listed in Table 12. The differences in dispositions between the age groups reflect the differences in types of referrals stated above.

For the 11 and under age group the most frequent disposition was transfer of legal custody to a public agency or department. The majority of these referrals were neglect-dependent related in which custody of the child was transferred to the Department of Welfare or other social service agencies. 43.2% of all dispositions in this age group involved a transfer of custody of some kind compared to 15.0%, 11.7%, and 8.6% for the 12-13, 14-15, and 16-17 age groups respectively.

The most frequent disposition among the older three age groups was formal probation. Approximately 40% of the referrals involving these three age groups received a disposition of formal probation with the percentage increasing as age increased. As stated above there was an

Sex

by sex is displayed in Figure 7. Of the 4458 total referrals, 3280 were males and 1178 were females. This corresponds only 18.7% for minor offenses. to percentages of 73.6% and 26.4% respectively.

offense referrals. This is a male to female ratio of over five to one. The same ratio in 1978 was over six to one indicating both a decrease in the male and an increase in the female tendency to be referred for a major offense.

The minor offense referrals were more evenly distributed between the sexes. Males with 613 minor referrals accounted for 58.7% and females with 432 accounted for 41.3%. This is approximately a three to two male to female

Neglect-dependent referrals is the only category in which females outnumbered males. Of the 551 neglectdependent referrals reported, 262 (47.5%) were males and 289 (52.5%) were females.

Females had roughly equal percentages of major and minor offense referrals. Major offenses accounted for 38.8% of total female referrals and minor offenses accounted for 36.7%.

Males, contrary to females, were far more likely to be male.

The percentage breakdown of juvenile court referrals referred for a major offense than a minor one. Of the total male referrals, 73.4% were for major offenses compared to

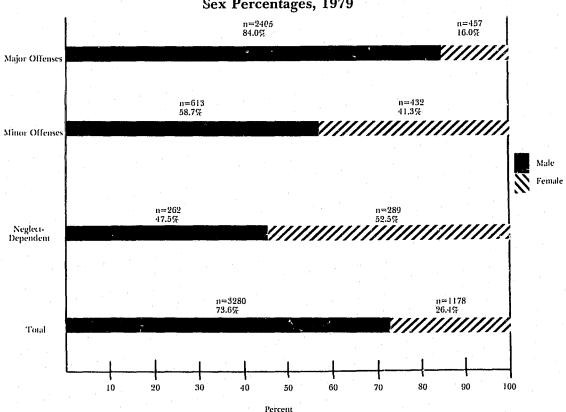

There was also a large difference between males and Males accounted for an 84.0% majority of the major females in the neglect-dependent referral category. Only 8.0% of all male referrals were neglect-dependent related compared to 24.5% for females.

> The disposition frequencies and percentages separated by sex are listed in Table 13. The most frequent disposition for both males and females was formal probation followed by dismissal with complaint not substantiated.

> Males were much more likely to be put on formal probation than females. 39.3% of all male referrals were disposed of by formal probation compared to only 25.0% for

> Females were more likely to receive a disposition resulting in a transfer of legal custody than males. 21.8% of female dispositions involved a transfer of legal custody compared to 12.4% for males. For females, the majority of these were transfer to a public institution other than a Youth Development Center. The probability that a female would be sent to a YDC was one-half the probability for a

Ethnic Group

Ethnic Group, or race, data collected by the Commis-Hispanic, oriental and "other". The referral frequencies and percentages for these groups are listed in Table 14.

Whites accounted for 84.7% of all juvenile court referrals, blacks 7.8%, Native Americans 2.3%, Hispanics 2.8% and "other" 2.4%. As an estimate of the actual proportion of these groups in the juvenile population, school enrollment data was obtained from the Department of Education. These figures show 92.3% of the juvenile population as being white, 4.5% black, 0.8% Native American, 1.8% Hispanic, and 0.6% "other".

The relationship between percentage of juvenile other groups the percentage of juveniles appearing in whites and 7.2% for Hispanics. court was higher than the percentage of juveniles of that group in the population.

88.9% of all black referrals came from the more highly sion include the categories: White, black, Native American, urban areas of Douglas and Lancaster Counties. 68.9% of Native American referrals and 76.8% of Hispanic referrals came from counties other than Douglas and Lancaster. For whites, 44.8% of the referrals were from Douglas and Lancaster Counties and 55.2% from other counties. Douglas and Lancaster Counties account for 37.7% of the juvenile population.

> For all ethnic groups, major offense referrals were most frequent. 75.1% of black referrals were for major offenses followed by Native Americans with 68.0%, Hispanics with 65.5%, and whites with 63.5%.

The differences in minor and neglect-dependent referpopulation and percentage of juvenile referrals is shown rals were less pronounced than in 1978. 27.2% of Hispanic graphically in Figure 8. Orientals are not depicted since referrals were for minor offenses followed by whites with they accounted for less than 0.1% of the total referrals. 25.1%, Native Americans with 15.5%, and blacks with Whites were the only group to have a larger percentage of 10.3%. 16.5% of Native American referrals were neglectthe juvenile population than of the total referrals. For all dependent related followed by 14.6% for blacks, 11.4% for

FIGURE 8

Comparison of Ethnic Group Referrals and Juvenile Population Proportions, 1979

Other Demographic Characteristics

Living Arrangement

The living arrangements of juveniles at time of referral are listed in Table 15. The most frequent living arrangement reported was living with both parents. The most frequent living arrangement among major and minor offense referrals was also with both parents, however, among neglect-dependent referrals the most frequent was with mother only.

Living with mother only was the second most often reported living arrangement. 48.3% of the living arrangements reported involved living with either a single parent or with a parent and stepparent. 14.8% of the reported arrangements involved no natural parent.

Employment and School Status

The reported employment and school status of juveniles referred to court are listed in Table 16. 67.4% of the juveniles for which school and employment status was reported were in school and unemployed. This was the most frequently reported category for major, minor, and neglect-dependent referrals.

The second most frequently reported category was in school and employed. Approximately 17% of the juveniles referred for either a major or a minor offense were in this category. The second most frequent category for neglect-dependent referrals was preschool.

Of the total referrals for which employment and school status were reported, 83.0% were in school, 11.6% not in school, and 5.4% preschool. In terms of employment, 75.0% were unemployed and 19.6% employed.

The distribution among the various categories is essentially the same regardless of whether the referral was for a major or minor offense.

Metropolitan Areas and Balance-of-State Comparison

Referrals to the separate juvenile courts of Douglas and Lancaster Counties comprised 47.4% of the total juvenile data reveals that 37.7% of Nebraska's juvenile population resides in these two counties. Douglas County reported 1,011 juvenile court referrals to the Commission, Lancaster County reported 1,105 referrals, and the remaining 2,342 referrals came from the Balance-of-State counties.

Before comparisons of referral patterns in these jurisdictions can be made, certain qualifications of the data must be made. Differences exist in the reporting practices of the Douglas County Juvenile Court and Lancaster County Juvenile Court.

In Douglas County, the County Attorney's office acts as the court intake for all juvenile referrals. Only cases which are filed with petition in the juvenile court by the County Attorney's office are reported to the Commission.

In Lancaster County, juvenile court intake is handled by the probation office. All cases which come to the attention of the court intake are reported to the Commission. These cases represent both cases which are disposed of informally by the court intake (without petition) and cases formally disposed of by the court (with petition).

Even though the juvenile population of Douglas County is nearly three times larger than that of Lancaster County, it appears that juvenile court activity in both juvenile courts is comparable. This is because the Lancaster County figure for juvenile court referrals includes both manners of handling for court referrals. In comparing only those cases handled with petition in Nebraska, we find that the rate of referral per 1,000 juvenile population is 10.98 in Douglas County, 11.53 in Lancaster County and 10.30 for the Balance-of-State. These figures indicate no marked differences in the referral rate of juvenile cases heard by judges in the metropolitan juvenile courts and in the Balance-of-State juvenile courts.

Figure 9 shows the referral pattern of total juvenile court referrals for major, minor, and neglect-dependent cases in Douglas, Lancaster and all other counties. Differences exist between Douglas and Lancaster Counties in the proportions of minor and neglect-dependent cases referred to the court. In Douglas County, minor referrals accounted for only 9.7% of the total referrals, whereas in Lancaster County these cases represented 19.0% of the total cases. For neglect-dependent cases, Douglas County reported that these comprised 24.2% of their total caseload. Neglect-dependent cases only accounted for 4.5% of the total juvenile referrals in Lancaster County.

Few major differences exist in the ways in which cases were disposed of in the Nebraska juvenile courts (Table court referrals in Nebraska in 1979. School enrollment 17). In Douglas County, 30.2% of the referrals were found to be unsubstantiated and dismissed. Only 11.6% and 12.4% of the referrals in Lancaster County and all other counties respectively were disposed of in this manner. Lancaster County disposes of 34.3% of the referrals by holding open the case without further action. This is remarkably different from Douglas County which did not dispose of any cases in this manner and all other counties where only 1.4% of the cases were held open. Another difference exists in the proportion of cases disposed of by referral to a public agency. Douglas County disposed of 20.9% of its referrals in this manner, while Lancaster County employed this disposition for only .3% of its referrals and other counties for only 4.9% of their total referrals. A possible reason for the high incidence of this disposition in Douglas County is the proportionally larger number of neglectdependent cases which are referred to that court.

> Table 18 shows the sources of referrals for these jurisdictions. The only major difference exists in Douglas County where 23.3% of the referrals are from social agencies compared to .8% in Lancaster County and 3.6% in all others. Again, this might be attributed to the large number of neglect-dependent cases handled in the Douglas County Juvenile Court relative to the other juvenile courts.
