NEBRASKA'S CRIME VICTIMS

Lynn K. White Department of Sociology

Price: \$1.00

MALE PROMINED CONTRACT

The Nebraska Annual Social Indicators Survey

Lynn K. White: 1978 Study Director

The findings in this report are based on data collected in the second Nebraska Annual Social Indicators Survey (NASIS). This survey is part of an on-going study of the quality of life in Nebraska conducted by the Bureau of Sociological Research at the University of Nebraska-Lincoln.

In 1978 a representative sample of 1940 Nebraskans eighteen years of age or older living in households were interviewed by telephone. The interview averaged approximately 50 minutes and included questions about environment, health, crime, political attitudes, occupation, education, family life and other matters reflecting the quality of life experienced in the state. For the entire sample, 95 out of 100 times the percentages computed from the items asked on the survey are likely to be accurate to within plus or minus 2.3 percent of the figure that would have been obtained if each adult in Nebraska had been surveyed. This is an estimate of maximum error and for most items the percentages are likely to be even more accurate.

The data gathered by NASIS are used by a wide variety of State and local government agencies for policy and program planning and by faculty and students at the University of Nebraska and other colleges for research. No information identifying any respondent is released to any user and the strict confidentiality of individual respondents is rigidly enforced. While the final responsibility for the organization and structure of the survey and for reports produced under its name rests with the Bureau of Sociological Research, public agencies and University departments play an integral part in planning the survey through an Advisory Committee. Public organizations interested in membership on the Advisory Committee should contact the NASIS Study Director.

Funding for NASIS comes from the University of Nebraska, the Bureau of Sociological Research, and State and local agencies which buy items and data analysis from the survey.

The NASIS surveys are repeated each year to measure changes in the quality of life in Nebraska. While there is a core of questions which is included every year, each survey has a large component of unique items which address specific topical issues. Plans for future years include reinterviewing the 1977 panel every two years to assess changes in their lives. Additional detail on the NASIS surveys regarding use of the survey data or cost of purchasing items on future surveys can be obtained by contacting Lynn K. White, NASIS Study Director, at the Bureau of Sociological Research or by sending for a copy of the 1979 NASIS Prospectus.

 rate from the previous year. Almost 60% of all victimizations involved vandalism (36%) or fraud (21%) - non-index crimes which are not included in the Uniform Crime Report's crime rate estimates. Less than half (43%) of all victimizations were reported to police. Motor Vehicle Theft and Burglary were most frequently reported (70% p fraud and rape least reported (minus 10%). The young, the non-white, and urban residents are the most likely gro to be victims of a crime. People under 30, though most likely to be victims are least likely to report an offense to law enforcement authorities. While roughly 3 out of 4 adults consider law enforcement agencies to effective in dealing with crime, only half consider the courts and the correctional system to be effective in dealing with crime. 60% of all Nebraska adults believe State government should "do more" in the area of crime prevention while only 1% believe the State shoul do less in this area.

1

Several national indexes of the quality of life have declared Nebraska to be one of the best places to live in the United States. An important factor in this high rating is the relatively low crime rate in Nebraska. The purpose of this report is to document the extent to which citizens in Nebraska do experience crime and the factors related to victimization.

In 1978 the Nebraska Commission on Law Enforcement and Criminal Justice commissioned the Nebraska Annual Social Indicators Survey to include a series of questions on crime victimization. The data in this report are based on the responses of a random sample of 1,940 adults living in households in Nebraska. Each respondent was asked whether they had been the victim of each of eight types of crime in the last year and, if they had, what had been their responses to the victimization. In the report, extent of victimization is related to place of residence, whether urban or rural, whether single-family or multiple-family units to race, to age, and to income. In addition, comparisons are shown between 1977 and 1978 responses which demonstrate that fewer Nebraskans were victims of crime in 1978 than in the previous year.

The purpose of such a victimization survey is to create a clearer picture of the frequency of crime and its attendant circumstances than is available from official statistics. While a far from perfect measuring device, such surveys do remove the confounding variable of victim reporting to police and increase the amount of pertinent demographic information available to criminal justice planners and public officials in their efforts to develop crime prevention programs and policies. Victimization surveys of several types have arisen in the last decade as a supplemental data source to the traditional source of crime statistics. known as the Uniform Crime Reports (UCR).

The UCR, in use since the 1930's, are comprised of crime data based on offenses reported to local police. These local data are then aggregated as the

2

state and national level where they stand as the official measure of crime rates and trends. Many crimes, however, are not reported to police and thus are excluded from official records. Thus, the UCR method cannot alone detect whether changes in crime, rates indicate a change in the frequency of crime or a change in the percent of crimes reported to the police. UCR data also exclude much a ta signa por p information describing the characteristics and trends of the people and property

victimized by crime.

. .

CONSIDERATIONS IN USING VICTIMIZATION DATA

While surveys provide the opportunity for a more detailed analysis of victimization characteristics of certain crimes, several considerations exist regarding their interpretation and comparison to UCR statistics. As mentioned unte fan hetsetin previously, the UCR reports only those crimes known to police. While victimiza-Les ligge get be tion surveys reveal more crime than is reported to police, they exclude certain categories of people and property. Only persons aged 18 or older were interviewed, so that crime rates for crimes of a personal nature (rape, robbery, assault) do not include victims under 18 years of age. Only households were contacted and questions concerning property crimes were limited to those against households, thus excluding businesses which are often the target of property offenses such as burglary and vandalism. People living in institutions, colleges and universities, tourists and other transients were not included in the survey. Although the sample size of the NASIS was 1,940, this is a fairly small number for analysis especially regarding typically low-frequency crimes such as rape, robbery, and assault.

A THE MARKED A LEFT RATE AND

Crimes against people (felony assault, robbery, forcible rape, fraud) accounted for 25.8% of all offenses. Collectively they occurred at a rate of 75/1,000 adults compared to 86/1,000 adults last year. Index crimes against people (felony assault, robbery, rape) occurred at a rate of 15/1,000 adults, compared to 30/1,000 adults last year. Several factors had notable relationships to the probability of victimization. They are briefly summarized below.

TYPE OF COMMUNITY

Residents of Omaha, while representing just under one-fourth of all NASIS respondents, reported almost one-third of all offenses reported in the survey, probably due to their reporting 42.2% of all multiple victimization.

TABLE :	3:	VICTIMIZATION	DATA	BY	TYPE	OF	COMMUNITY

	% of NASIS SAMPLE	% of Respondents Victimized	% of all Victims	% of all Offenses	% of all Multiple Victimization

TABLE 4: VICTIMICATION DATA BY AGE OF RESPONDENTS

Despite the relatively small number of non-white respondents contacted in the survey, they reported a significantly higher rate of victimization than V

Comparisons between NASIS victimization ratio and UCR crime rates are awkward due to several factors. Many of the crimes reported in the survey were not reported to police (more about this later). Due to weighing factors used in compiling the survey responses, household crimes in NASIS are reported "per 1,000 households" rather than "per 1,000 population" used in the UCR. Also, crimes against persons are reported in NASIS as "per 1,000 adults" as opposed to "per 1,000 population", since only adults were questioned in the survey. Another confounding factor concerns the surveyor and respondent correctly categorizing an offense. We cannot be certain to what extent events reported in the NASIS are consistent with how a police recorder would rate an offense. For example, an offense considered a felony assault by a NASIS respondent may, if it was reported to the police, have been considered only a misdemeanor assault in the official report. To what extent this factor may operate in the NASIS cannot be measured without extensive follow-up studies. We can, however, look at the relative frequency of index crimes within the UCR and NASIS reports.

% Total Index Crimes	UCR	Rank	NASIS	% Total Index Crimes

100%				100%

TABLE 6:RANK AND PERCENT DISTRIBUTION OF INDEX CRIMESUCR AND NASIS FIGURES - 1977

* Different Rankings for Felony Assault, Motor Vehicle Theft

Though both reporting systems show Larceny-Theft and Burglary as the most prevalent index offenses, they disagree considerably on the percentage of all index crimes each of these offenses represent. This may be due to the fact that the two crimes often occur simultaneously and some victims give the burglary episode precedence over the larceny-theft episode, or consider the burglary to include the theft. It is also partially explainable by the fact that the UCR category include all reported offenses as opposed to the NASIS restriction to households.

VICTIM REPORTING OF CRIMES TO AUTHORITIES

One of the most notable features of victimization surveys in general is the volume of crime they reveal which is never reported to a law enforcement agency.

Of the 561 crimes reported to the NASIS only 43% (243) had been reported to a law enforcement agency. This represents a 6% decline from the percent of crimes reported to police last year. Among those not reporting, the most common specific reason was that it was "useless to report" (25.5%). 15.8% thought the incident was "not important enough" and 11.1% said they did not report an offense because the offender was a friend. Fraud was the least reported crime (9%) while Motor Vehicle Thefts was most often reported (74%) followed by Burglary (70%).

We find the rate of reporting to increase, if only index crimes are considered, to 53%. Index crime victims in Omaha reported crimes to police most frequently (63%) followed by small towns (55%) and farm or ranch victims (50%). Least likely to report index offenses to police were victims in Lincoln and first class towns (pop. 2,500-50,000) where only 45% of all index crimes were reported.

	A		
Type of Community	% of Sample	% of all Index Crimes	% of Index Crimes Reported to Police

Omaha	24.2%	30.1%	63%
TOTALS	100%	100%	Ave - 52.7%

TABLE 7: REPORTING OF INDEX OFFENSES

BY TYPE OF COMMUNITY

A significant relationship exists between the age of a victim and the reporting of offense to police. Victims between the ages of 18-30 - the group most likely to be victims of an index offense - are the least likely to report an offense to police (43%). Most likely to report are those in the 46-60 age group (65).

TABLE 8: VICTIMIZATION AND REPORTING CHARACTERISTICS BY AGE GROUP

Age Group	% of Sample	% of all Index Crimes	% of Index Crimes Reported to Polic	
18-30	31.9%	44.5%	43%

WITNESSES

≈(?

Only 2.5% of the respondents reported witnessing a crime. Slightly over one-half of those witnessing a crime reported it to authorities. INSURANCE/LOSS OF PROPERTY Only 13% of those victims who suffered a loss of property as a result of a crime were fully insured for their losses. Another 15% were partially covered by insurance and almost two-thirds of the property-loss victims had no insurance coverage for their losses. 4 out of 5 victims who had property stolen recovered none of their losses. ATTITUDE QUESTION IN SURVEY As mentioned earlier, 43% of those victimized by a crime reported it to

a law enforcement agency. Of these, approximately two-thirds said they were satisfied with how police handled the incident. All respondents were asked to rate the effectiveness of the 3 components

of the criminal justice system.

Of 1,914 respondents to this question, 72 reported a successful attempt and 7 an unsuccessful attempt. Combined, this means 4.2% of all households were burglarized - more than 3 times the rate indicated by using UCR figures for residential burglaries and Department of Economic Development figures • • for total households in the State. Burglary accounted for 35% of the index crimes and 14% of all offenses reported in the NASIS.

Omaha reported the highest burglary rate (72/1,000 households) while communities under 2,500 population had the lowest rate (18/1,000 households). Lincoln and the first-class cities (pop. 2,500-50,000) averaged about 39/1,000 households.

Multiple living units (apartments, duplexes, etc.) averaged 56 burglaries per 1,000 households while single family homes experienced a burglary at the rate of 38/1,000 households.

Households in which total income was under \$10,000 had the highest burglary rate (53/1,000 households), while households earning over \$20,000 annually had the lowest rate (32/1,000 households).

Non-white households experienced a considerably higher victimization rate for burglary (97/1,000 households), white households (39/1,000 households).

LARCENY-THEFT - "During the last 12 months, did anyone steal something from you without threatening you or using force and without breaking into your home? (Not including auto theft or theft from auto.)"

Of 1,914 respondents to this question, 104 reported being a larceny-theft. victim (103 successful, 1 attempted). This puts the NASIS victimization rate for larceny-theft at 54/1,000 households compared to 32/1,000 households rate derived from UCR and Dept. of Economic Development figures. Larceny-theft accounted for 46% of the index crimes and 18.5% of all offenses reported in the NASIS.

First-class towns (pop. 2,500-50,000) reported the highest victimization rate (67/1,000 households) while Omaha and farm/ranch residents reported the lowest rate (40/1,000 households). Lincoln and communities under 2,500 population averaged 59 larceny-thefts per 1,000 households.

The likelihood of larceny-theft victimization was somewhat higher for the low-income group (under \$10,000 - 65/1,000 households) than for the higher income group (over \$20,000 - 54/1,000 households).

The 31 year old to 45 year old age group was the most frequent victim of a larceny-theft (77/1,000) followed by the 18-30 age group (60/1,000). Least likely to be a larceny-theft victim were those over 60 years of age (24/1,000).

Only 40.5% of the larceny-thefts incidents were reported to a law enforcement agency. Of these 70% were satisfied with police handling of the case.

Of those not reporting the crime to police, over one-half of the victims did not report because the incident was "not important enough" (27%) or they considered it "useless to report" (24%). 14% did not report to the police because the offender was a friend.

50% of the larceny-theft involved losses of \$50 or less. This may serve to indicate why the overall rate of reporting to police was low and why so many felt it useless or not important enough to report.

1 Mar Beg Broger

19 out of 1,914 respondents to this question reported having been a victim of motor vehicle theft. This translates into a rate of 10/1,000 households (compared to the 7/1,000 households rate based on UCR and Dept. of Economic 0 Development figures). Motor vehicle theft accounted for 8.4% of the index offenses and 3.4% of all offenses reported in the NASIS. Of the 19 MVT's, 8 involved automobiles, 5 involved trucks, 3 were motorcycles and 3 were other types of vehicles.

. .

.

CRIMES AGAINST PEOPLE

ASSAULT - "During the last 12 months, did anyone beat you or attack vou with a knife, gun, club or other weapon?"

Of the 1,911 respondents to this question, a total of 21 persons reported Sec. Sec. being victims of a personal attack (19 struck, 2 not struck). This constitutes 10. 101 an assault victimization rate of 11/1,000 adults - 18 and over. The UCR felony assault rate for 1977 is considerably lower - 1.1/1,000 population. The question as asked in the NASIS did not identify the seriousness of the attack and therefore it is assumed that the figures include both less common felony assaults and the more common misdemeanor assaults.

Omaha reported 9 assault victimizations out of 456 respondents, or a rate of 20/1,000 adults. Lincoln and first-class towns (pop. 2,500 - 50,000) experienced assault at a rate of 13/1,000 adults. Only 1 assault was reported from small town (under 2,500) respondents and none were reported by farm/ranch respondents in the NASIS.

All but one of the actual assaults involved the 18-30 age group which reported an assault rate of 30/1,000 adults. The 31-60 age group reported only 2 assaults per 1,000 adults. Respondents over 60 years of age reported no assaults.

Men, aged 18-30, accounted for two-thirds of all assault victimization and the overall rate for males was 14.5/1,000 adult men. Women reported being assault victims at the rate of 7/1,000 adult women.

¹² 28

Respondents who were married reported a much lower victimization rate (4.4/1,000 adults) than unmarried respondents (25.7/1,000 adults).

adult population.

Only 1 out of 4 assaults were reported to a law enforcement agency, all within one hour of their occurrence. Of the 15 victims who did not report to police, 4 said they did not report because the assailant was a friend, 4 didn't consider the incident important enough, one feared retaliation and one was too busy.

Respondents earning \$10,000--\$20,000 annually had the highest victimization rate (19/1,000 adults) followed by the under \$10,000 income group (14/1,000). Those earning over \$20,000 reported only 2 assaults per 1,000

RAPE - "During the last 12 months, did anyone try to sexually assault, molest, or rape you?"

the base to be Of the 1,032 women responding to this question, 1 reported an acutal rape and 3 reported an attempted rape for an overall victimization rate of 3.8/1,000 adult women. The total number of actual and attempted rapes reported in this survey was too small for statistical analysis, though it does reflect a decrease from the 10 rape incidents reported in last year's NASIS. It should be noted that none of the 4 victims reported the incident to police, and 3 of the 4 victims identified the assailant as a friend. and the second second

ROBBERY - "During the last 12 months, did anyone take something directly from you such as your wallet, purse, money, or other valuables by using force or threatening you?"

Of the 1,911 respondents to this question, 3 reported being the victim of a successful robbery and 1 reported an attempted robbery for an overall rate of 2.1/1,000 adults. Robbery accounted for 1.7% of all index crimes reported in the NASIS. Two of the robberies were reported (within an hour of their occurrence) and two were not reported because the victim considered it ·T1 ... "useless to report."

Maria de de de la compañía de la com The three victims of a successful robbery were all from Omaha. All four victims were white and married, one was a woman. As was the case with rape, the number of robbery victims was too small for statistical analysis. It should be noted, however, that the four victimizations are a decrease from the 14 reported in last year's NASIS using a comparable sample size.

a secondar a construction and a construction of the spectra of second tages on a generation of

FRAUD - "During the last 12 months, did anyone cheat you out of your money or property by lying to you or not keeping a promise, guarantee, or warranty on an item or service which you bought?"

Of the 1,909 respondents to this question, 108 reported being the victim of a successful fraud and 8 of an attempted fraud for an overall rate of 60/1,000 adults.

2

and the property of the second states of the The highest victimization rates for fraud occurred in Omaha (75/1,000 adults) and small communities under 2,500 population (73/1,000 adults). Firstclass towns (pop. 2,500 - 50,000) had a rate of 57/1,000; Lincoln - 47/1,000; and farm/ranch 35/1,000. na ar fir channaí a trata se a transceir a seo prios a tratación de construction de constructions de construct

Non-white respondents experienced a fraud victimization rate of 183/1,000 adults - considerably higher than the 56/1,000 rate for white adults.

Men were victimized at more than twice the rate women experienced (M = 83/1,000; F = 41/1,000).

A strong relationship existed between age and the rate of victimization. The youngest group (18-30 years) experienced fraud at the rate of 93/1,000, followed by the 31-45 age group at 73/1,000. Those over 45 had a victimization of only 29/1,000 - less than one-half the average rate.

· <u>3</u>2

Less than 1 out of 10 fraud incidents were reported.

CONCLUSION

The purpose of victimization surveys is to report the volume and circumstances of crime from the victims' point of view as opposed to the records of law enforcement agencies. The need for such an approach is indicated by the fact that almost 3 out of 5 victimizations are not reported to police. If police are not notified of a crime, they cannot respond to it, record it, assist the victim or apprehend the offender - meaning the crime is a successful one.

This study and others in recent years show that many victims choose not to report a crime so as to avoid the often complex and cumbersome procedures of the criminal justice system. While law enforcement, the "front line" of the criminal justice system, ranks highest in the public's view (72% consider police effective in dealing with crime), the courts and correctional system, which from the public's viewpoint lie deeper within the system, are rated effective by only 50% of the public. And those who did bother to report a crime rated police more effective (75%) while they rated the courts and correctional 3. Strange system considerably less effective (44%) than those who had not experienced a victimization. Insurance requirements probably accounted for the most often reported crimes of motor vehicle theft and burglary.

The majority of victims surveyed were targets of vandalism and fraud offenses not included in the calculation of index crime rates in the Uniform Crime Report. These were also two of the crimes least frequently reported to police. If only the six index crimes are considered, the rate of victim reporting to police increases from 43% to 53%.

Comparisons between the crime rates of the Uniform Crime Report and
