Introduction

The objective of this publication is to supplement historical Crime in the United States statistics by providing Uniform Crime Reporting (UCR) data users with arrest statistics related to the age of arrestees. Age-specific arrest rates and the average age of arrestees are tabulated for the eight Index crimes (murder, forcible rape, robbery, aggravated assault, burglary, larceny-theft, motor vehicle theft, and arson) and drug abuse violations for each of the 19 years during the period 1965-1983. It should be noted that all statistics in this publication pertain to national totals.

An age-specific arrest rate refers to the (annual) number of arrests made per 100,000 inhabitants belonging to a prescribed age group. Technical Note A describes the computational procedures used to derive age-specific arrest rates. The method used to estimate the average age of arrestees is delineated in Technical Note C. Since the average age of arrestees generally mirrors the age composition of the U.S. population, any shift in the age structure of arrestees should be examined in terms of how age-specific arrest rate statistics are affected.

Methodological Issues

Arrest data presented in this report were obtained from the Uniform Crime Reporting (UCR) Program and cover the 19-year period, 1965-1983. UCR arrest data as they relate to age-specific arrest rates have undergone the following historical changes:

1. With respect to the classification of age, the categories "10 and under" and "11 and 12" were used through 1979. Starting in 1980, these categories were replaced by the age groups "under 10" and "10 through 12."

2. UCR arrest data were gathered annually until 1973. In 1974, monthly reporting of arrest data was implemented.

3. In 1980, the "age not known" category was dropped. The impact of this action was negligible as the category constituted only a fraction of one percent of total arrests.

For purposes of this report, in order to make the classification of age data prior to 1974 comparable with the data published in succeeding years, the two categories involving individuals up to the age of 12 were combined into a "12 and under" category. With respect to 1965-1973 age-specific arrest rates, only the arrest data and the populations of agencies having submitted complete annual arrest statistics were used. For the period 1974-1983, only arrest data from agencies having submitted complete 12-month reports and corresponding population were utilized. No attempt was made to estimate or include arrest data for agencies reporting statistics for

11 months or less. The number of agencies represented in this report and their respective populations are listed below:

An age-specific arrest rate refers to the number of arrests made per 100,000 inhabitants belonging to a prescribed age group. The size of population pertaining to a prescribed age group

was computed, for each year, by distributing the UCR contributors population through the use of age distributions derived from U.S. Census publications. The source of population data used in this report is from the Current Population Reports series as listed below:

1965-1969 Series P-25, No. 519

1970-1979 Series P-25, No. 917

1980-1982 Series P-25, No. 929

1983 Series P-25, No. 949

For further discussion of age-specific population basis, see Technical Note B.

Adjusting Population to be Consistent with UCR Arrest Data

The UCR Program counts an offender's age at the time of arrest. Two extreme cases are presented below for illustration.

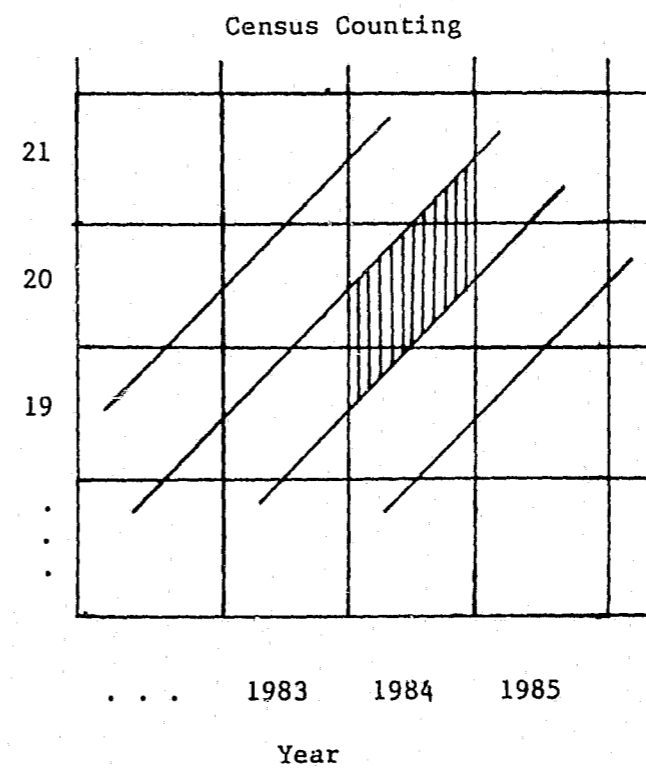

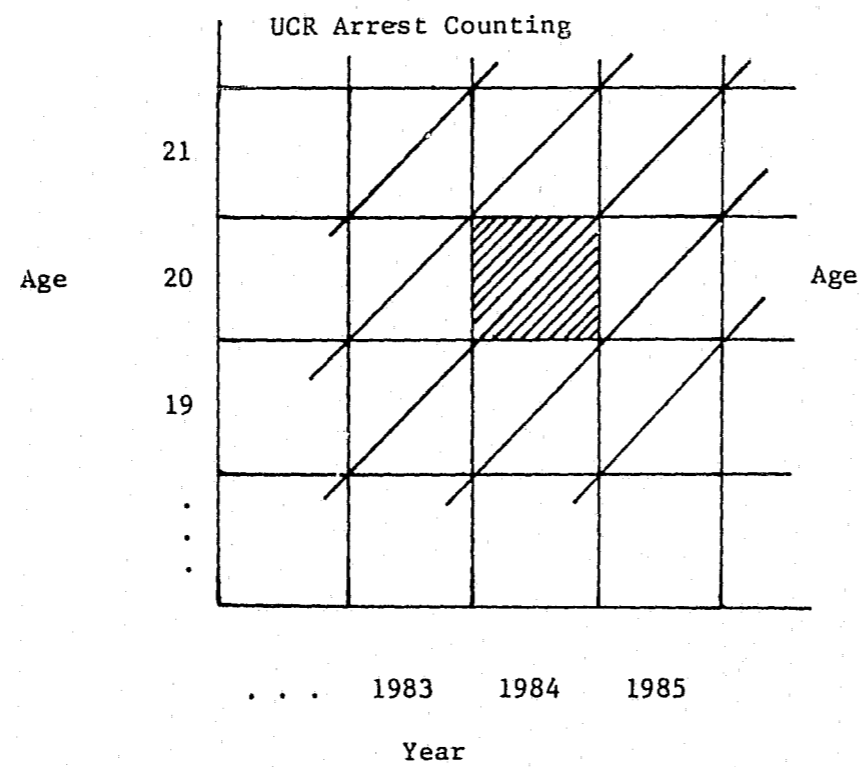

Example 1. Robert was born on January 2, 1963. If Robert is arrested before his 21st birthday (January 1, 1984), one arrest is counted for 1984 in the 20-year-old UCR arrest data category.

Example 2. James was born on December 30, 1964. If he is arrested after his 20th birthday (December 31, 1984), his arrest is also included in the 1984 20-year-old UCR arrest data category.

It should be noted that the dates of birth of these two individuals are virtually two years apart, although according to UCR procedures their arrests are included in the 20-year-old age group for the same year.

The U.S. Bureau of the Census, on the other hand, counts population on a fixed day of a given year, e.g., on the first day of July. The Census 20-year-old age category, for example, includes individuals whose dates of birth are between July 2, 1963 and July 1, 1964. Therefore, neither of the two persons discussed above would fall into this age group; under this procedure, Robert, born January 2, 1963, is considered to be 21 years old and James would be classified as 19.

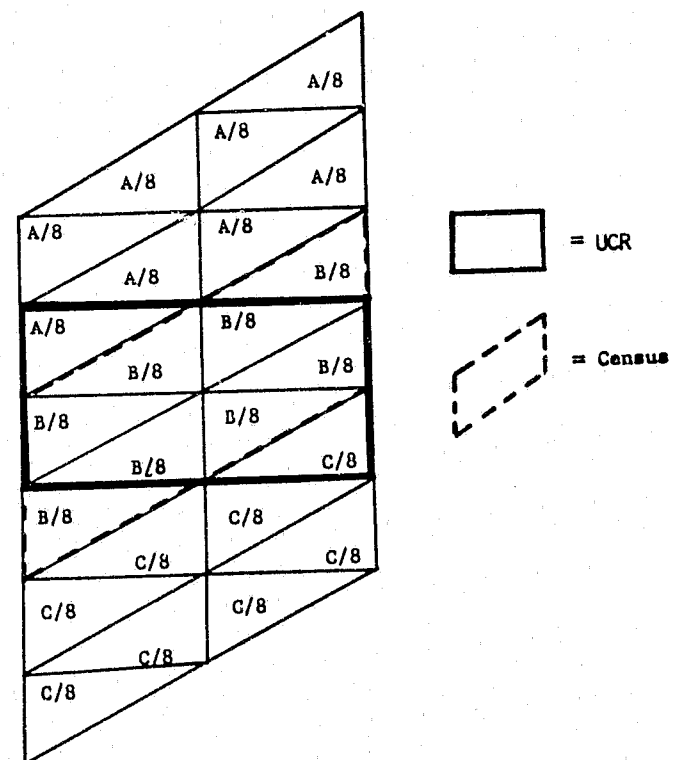

Lexis diagrams are used below to graphically illustrate the difference between the UCR and Census Bureau methods of classifying population. Vertical lines distinguish calendar years, horizontal lines distinguish ages, and diagonal lines separate the cohorts of people by date of birth. The shaded areas represent "20-year-olds."

The computation of age-specific arrest rates should be performed by adjusting either the numerator (UCR arrest data) or the denominator (population) so that they are compatible. A method of adjusting population figures to UCR arrest data is suggested below. Let A, B, and C be Census population for ages $j - 1$, j , and $j + 1$, respectively. Then, the population adjusted to UCR arrest data, for age j , is given by

$$\int_{-1}^{-1/2} A(1 - |x|)dx + \int_{-1/2}^{1/2} B(1 - |x|)dx + \int_{1/2}^1 C(1 - |x|)dx = (A + 6B + C)/8.$$

This formula is graphically presented in the following diagram:

Application of the aforementioned adjustment generates certain changes in age-specific arrest rates. In this publication, however, UCR contributors' total populations were distributed directly through the use of age distributions derived from U.S. Census publications (see Technical Note A).

Technical Note C

A Method for Computing the Average Age of Arrestees from UCR Data

UCR arrest data can be broken down into age groups; some are single-age categories (e.g., 20-year-old category) while others are multiple-age categories (e.g., 20-24-year-old category). This type of classification scheme is not a convenient basis for computing the average age of arrestees. A simple method of overcoming this difficulty is suggested below.

Let $[x', x'')$ denote the age interval $\{x | x' \leq x < x''\}$. For example, the UCR age group "25 through 29" is expressed as $[25, 30)$. Let $[x_0, x_1)$, $[x_1, x_2)$, $[x_2, x_3)$ be consecutive age intervals, and $f(x)$ be a quadratic function of the form $f(x) = 3ax^2 + 2bx + c$. It is required that the function $f(x)$ satisfies the following conditions:

$$(1) \int_{x_0}^{x_1} f(x)dx = D, \quad \int_{x_1}^{x_2} f(x)dx = E, \quad \text{and} \quad \int_{x_2}^{x_3} f(x)dx = F,$$

where D , E , and F represent the number of UCR arrests for the consecutive age intervals $[x_0, x_1)$, $[x_1, x_2)$, and $[x_2, x_3)$.

The system of equations (1) can be solved for the unknowns a , b , and c . Using the notation

$$G = \begin{vmatrix} x_1^3 - x_0^3 & x_1^2 - x_0^2 & x_1 - x_0 \\ x_2^3 - x_1^3 & x_2^2 - x_1^2 & x_2 - x_1 \\ x_3^3 - x_2^3 & x_3^2 - x_2^2 & x_3 - x_2 \end{vmatrix}, \quad H = \begin{vmatrix} D & x_1^2 - x_0^2 & x_1 - x_0 \\ E & x_2^2 - x_1^2 & x_2 - x_1 \\ F & x_3^2 - x_2^2 & x_3 - x_2 \end{vmatrix},$$

$$I = \begin{vmatrix} x_1^3 - x_0^3 & D \\ x_2^3 - x_1^3 & E \\ x_3^3 - x_2^3 & F \end{vmatrix} \quad \text{and} \quad J = \begin{vmatrix} x_1^2 - x_0^2 & D \\ x_2^2 - x_1^2 & E \\ x_3^2 - x_2^2 & F \end{vmatrix}$$

the solution for (1) is expressed as

$$(2) \quad a = H/G, \quad b = I/G, \quad \text{and} \quad c = J/G.$$

The distribution $f(x)/E$, $x_1 \leq x < x_2$, is then applied to obtain the average age of the arrestees on the interval $[x_1, x_2)$:

$$(3) \quad \int_{x_1}^{x_2} x \cdot f(x)/E dx = \left[9(x_2^4 - x_1^4)H + 8(x_2^3 - x_1^3)I + 6(x_2^2 - x_1^2)J \right] / 12EG$$

Therefore, the average age is represented by the weighted sum over all age intervals.

The result of this model is presented on page 73.
